EXTENDED TEMPERATURE RANGE SERIAL INTERFACE CODEC/FILTER

- – 40 °C TO + 85 °C OPERATION
- COMPLETE CODEC AND FILTERING SYSTEM (COMBO) INCLUDING :
  - Transmit high-pass and low-pass filtering
  - Receive low-pass filter with sin x/x correction
  - Active RC noise filters
  - A-law or μ-law compatible COder and DECoder
  - Internal precision voltage reference
  - Serial I/O interface
  - Internal auto-zero circuitry
- A-LAW, 16-PINS - ETC5057
- μ-LAW WITHOUT SIGNALING, 16-PINS - ETC5054
- MEETS OR EXCEEDS ALL D3/D4 AND CCITT SPECIFICATIONS
- ± 5 V OPERATION
- LOW OPERATING POWER - TYPICALLY 60 mW
- POWER-DOWN STANDBY - TYPICALLY 3 mW
- AUTOMATIC POWER-DOWN
- TTL OR CMOS COMPATIBLE DIGITAL INTERFACES
- MAXIMIZES LINE INTERFACE CARD CIRCUIT DENSITY
- SECOND SOURCE OF TP3057, TP3054

DESCRIPTION

The ETC5057/ETC5054 family consists of A-law and μ-law monolithic PCM CODEC/filters utilizing the A/D and D/A conversion architecture shown in figure 1, and a serial PCM interface. The devices are fabricated using double-poly CMOS process.

The encode portion of each device consists of an input gain adjust amplifier, an active RC pre-filter which eliminates very high frequency noise prior to entering a switched-capacitor band-pass filter that rejects signals below 200 Hz and above 3400 Hz. Also included are auto-zero circuitry and a companding coder which samples the filtered signal and encodes it in the companded A-law or μ-law PCM format. The decode portion of each device consists of an expanding decoder, which reconstructs the analog signal from the companded A-law or μ-law code, a low-pass filter which corrects for the sin x/x response of the decoder output and rejects signals above 3400 Hz and is followed by a single-ended power amplifier capable of driving low impedance loads. The devices require 1.536 MHz, 1.544 MHz, or 2.048 MHz transmit and receive master clocks, which may be asynchronous, transmit and receive bit clocks which may vary from 64 kHz to 2.048 MHz, and transmit and receive frame sync pulses. The timing of the frame sync pulses and PCM data is compatible with both industry standard formats.

PIN CONNECTION

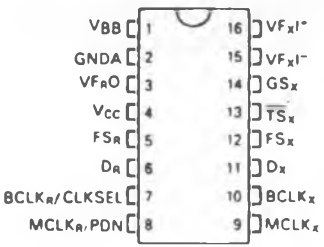

Figure 1 : Block Diagram.

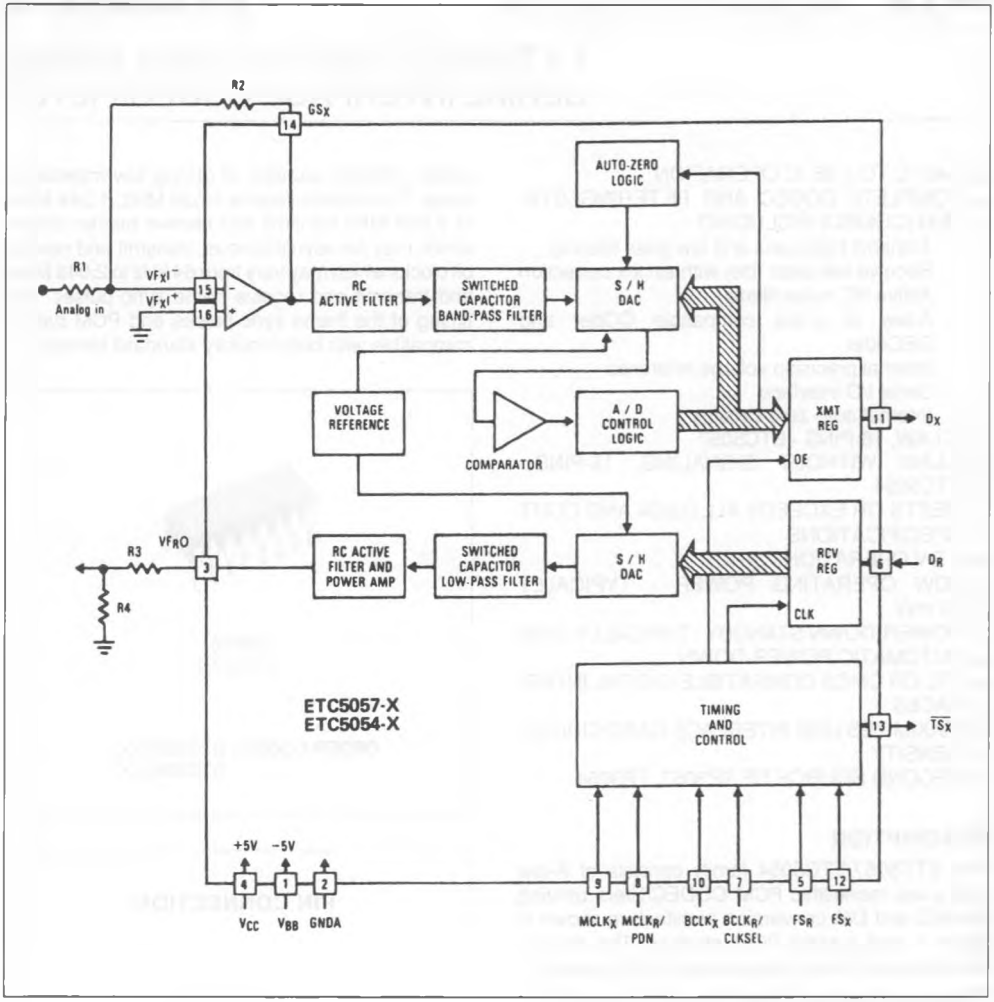

PIN DESCRIPTION

Name	Pin Type*	N°	Function	Description
V_{BB}	S	1	Negative Power Supply	$V_{BB} = -5 \pm 5$ %
GNDA	GND	2	Analog Ground	All signals are referenced to this pin.
VF_RO	O	3	Receiver Filter Output	Analog Output of the Receive Filter
V_{CC}	S	4	Positive Power Supply	$V_{CC} = +5 \pm 5$ %
FS_R	I	5	Receive Frame Sync Pulse	Enable $BCLK_R$ to shift PCM data into D_R. FS_R is an 8 kHz pulse train. See figures 2,3 and 4 for timing details.
D_R	I	6	Receive Data Input	PCM data is shifted into D_R following the FS_R leading edge.
$BCLK_R$/CLKSEL	I	7	Shift-in Clock	Shifts data into DR after the FS_R leading edge. May vary from 64 kHz to 2.048 MHz. Alternatively, may be a logic input which selects either 1.536 MHz/1.544 MHz or 2.048 MHz for master clock in synchronous mode and $BCLK_X$ is used for both transmit and receive directions (see table 1). This input has an internal pull-up.
$MCLK_R$/PDN	I	8	Receive Master Clock	Must be 1.536 MHz, 1.544 MHz or 2.048 MHz. May be asynchronous with $MCLK_X$, but should be synchronous with $MCLK_X$ for best performance. When $MCLK_R$ is connected continuously low, $MCLK_X$ is selected for all internal timing when MCLKR is connected continuously high, the device is powered down.
$MCLK_X$	I	9	Transmit Master Clock	Must be 1.536 MHz, 1.544 MHz or 2.048 MHz. May be asynchronous with $MCLK_R$.
FS_X	I	12	Transmit Frame Sync Pulse	Enables $BCLK_X$ to shift out the PCM data on D_X. FS_X is an 8 kHz pulse train. See figures 2, 3 and 4 for timing details.
$BCLK_X$	I	10	Shift out Clock	Shifts out the PCM data on D_X. May vary from 64 kHz to 2.048 MHz, but must be synchronous with $MCLK_X$.
D_X	O	11	Transmit Data Output	The TRI-STATE® PCM data output which is enabled by FS_X.
$\overline{TS_X}$	O	13	Transmit Time Slot	Open drain output which pulses low during the encoder time slot. Must be grounded if not used.
GS_X	O	14	Gain Set	Analog output of the transmit input amplifier. Used to set gain externally.
VF_XI^-	I	15	Inverting Amplifier Input	Inverting input of the transmit input amplifier.
VF_XI^+	I	16	Non-inverting Amplifier Input	Non-inverting input of the transmit input amplifier.

* I : Input, o : Output, S : Power Supply.
TRI-STATE ® is a trademark of National Semiconductor Corp.

FUNCTIONAL DESCRIPTION

POWER-UP

When power is first applied, power-on reset circuitry initializes the COMBO and places it into the power-down mode. All non-essential circuits are deactivated and the D_X and VF_RO outputs are put in high impedance states. To power-up the device, a logical low level or clock must be applied to the $MCLK_R$/PDN pin and FS_X and/or FS_R pulses must be present. Thus, 2 power-down control modes are available. The first is to pull the $MCLK_R$/PDN pin high ; the alternative is to hold both FS_X and FS_R inputs continuously low. The device will power-down approximately 2 ms after the last FS_X or FS_R pulse. Power-up will occur on the first FS_X of FS_R pulse. The TRI-STATE PCM data output, D_X, will remain in the high impedance state until the second FS_X pulse.

SYNCHRONOUS OPERATION

For synchronous operation, the same master clock and bit clock should be used for both the transmit and receive directions. In this mode, a clock must be applied to $MCLK_X$ and the MCLKR/PDN pin can be used as a power-down control. A low level on $MCLK_R$/PDN powers up the device and a high level powers down the device. In either case, $MCLK_X$ will be selected as the master clock for both the transmit and receive circuits. A bit clock must also be applied to $BCLK_X$ and the $BCLK_R$/CLKSEL can be used to select the proper internal divider for a master clock of 1.536 MHz, 1.544 MHz or 2.048 MHz. For 1.544 MHz operation, the device automatically compensates for the 193 rd clock pulse each frame.

With a fixed level on the $BCLK_R$/CLKSEL pin, $BCLK_X$ will be selected as the bit clock for both the transmit and receive directions. Table 1 indicates the frequencies of operation which can be selected, depending on the state of $BCLK_R$/CLKSEL. In this synchronous mode, the bit clock, $BCLK_X$, may be from 64 kHz to 2.048 MHz, but must be synchronous with $MCLK_X$.

Table 1. Selection of Master Clock Frequencies.

$BCLK_R$/CLKSEL	Master Clock Frequency Selected	
	ETC 5057	ETC 5054
Clocked	2.048 MHz	1.536 MHz or 1.544 MHz
0	1.536 MHz or 1.544 MHz	2.048 MHz
1 (or open circuit)	2.048 MHz	1.536 MHz or 1.544 MHz

Each FS_X pulse begins the encoding cycle and the PCM data from the previous encode cycle is shifted out of the enabled D_X output on the positive edge of $BCLK_X$. After 8 bit clock periods, the TRI-STATE D_X output is returned to a high impedance state. With an FS_R pulse, PCM data is latched via the D_R input on the negative edge of $BCLK_X$ (or $BCLK_R$ if running). FS_X and FS_R must be synchronous with $MCLK_{X/R}$.

ASYNCHRONOUS OPERATION

For asynchronous operation, separate transmit and receive clocks may be applied. $MCLK_X$ and $MCLK_R$ must be 2.048 MHz for the ETC5057, or 1.536 MHz, 1.544 MHz for the ETC5054, and need not be synchronous. For best transmission performance, however, $MCLK_R$ should be synchronous with $MCLK_X$, which is easily achieved by applying only static logic levels to the $MCLK_R$/PDN pin. This will automatically connect $MCLK_X$ to all internal $MCLK_R$ functions (see Pin Description). For 1.544 MHz operation, the device automatically compensates for the 193 rd clock pulse each frame. FS_X starts each encoding cycle and must be synchronous with $MCLK_X$ and $BCLK_X$. FS_R starts each decoding cycle and must be synchronous with $BCLK_R$. $BCLK_R$ must be a clock, the logic levels shown in Table 1 are not valid in asynchronous mode. $BCLK_X$ and $BCLK_R$ may operate from 64 kHz to 2.048 MHz.

SHORT FRAME SYNC OPERATION

The COMBO can utilize either a short frame sync pulse or a long frame sync pulse. Upon power initialization, the device assumes a short frame mode. In this mode, both frame sync pulses. FS_X and FS_R, must be one bit clock period long, with timing relationships specified in figure 3. With FS_X high during a falling edge of $BCLK_X$, the next rising edge of $BCLK_X$ enables the D_X TRI-STATE output buffer, which will output the sign bit. The following seven rising edges clock out the remaining seven bits, and the next falling edge disables the D_X output. With FS_R high during a falling edge of $BCLK_R$ ($BCLK_X$ in synchronous mode), the next falling edge of $BCLK_R$ latches in the sign bit. The following seven falling edges latch in the seven remaining bits. Both devices may utilize the short frame sync pulse in synchronous or asynchronous operating mode.

LONG FRAME SYNC OPERATION

To use the long frame mode, both the frame sync pulses, FS_X and FS_R, must be three or more bit clock periods long, with timing relationships specified in figure 4. Based on the transmit frame sync. FS_X, the

COMBO will sense whether short or long frame sync pulses are being used. For 64 kHz operation, the frame sync pulse must be kept low for a minimum of 160 ns (See Fig. 2). The D_X TRI-STATE output buffer is enabled with the rising edge of FS_X or the rising edge of $BCLK_X$, whichever comes later, and the first bit clocked out is the sign bit. The following seven $BCLK_X$ rising edges clock out the remaining seven bits. The D_X output is disabled by the falling $BCLK_X$ edge following the eighth rising edge, or by FS_X going low, whichever comes later. A rising edge on the receive frame sync pulse, FS_R, will cause the PCM data at D_R to be latched in on the next eight falling edges of $BCLK_R$ ($BCLK_X$ in synchronous mode).

Both devices may utilize the long frame sync pulse in synchronous or asynchronous mode.

TRANSMIT SECTION

The transmit section input is an operational amplifier with provision for gain adjustment using two external resistors, see figure 5. The low noise and wide band-width allow gains in excess of 20 dB across the audio passband to be realized. The op amp drives a unity-gain filter consisting of RC active prefilter, followed by an eighth order switched-capacitor bandpass filter clocked at 256 kHz. The output of this filter directly drives the encoder sample-and-hold circuit. The A/D is of companding type according to A-law (ETC5057) or μ-law (ETC5054) coding conventions. A precision voltage reference is trimmed in manufacturing to provide an input overload (t_{MAX}) of nominally 2.5 V peak (see table of Transmission Characteristics). The FS_X frame sync pulse controls the sampling of the filter output, and then the successive-approximation encoding cycle begins. The 8-bit code is then loaded into a buffer and shifted out through D_X at the next FS_X pulse. The total encoding delay will be approximately 165 μs (due to the transmit filter) plus 125 μs (due to encoding delay), which totals 290 μs. Any offset voltage due to the filters or comparator is cancelled by sign bit integration.

RECEIVE SECTION

The receive section consists of an expanding DAC which drives a fifth order switched-capacitor low pass filter clocked at 256 kHz. The decoder is A-law (ETC5057) or μ-law (ETC5054) and the 5th order low pass filter corrects for the sin x/x attenuation due to the 8 kHz sample and hold. The filter is then followed by a 2 nd order RC active post-filter and power amplifier capable of driving a 600 Ω load to a level of 7.2 dBm. The receive section is unity-gain. Upon the occurence of FS_R, the data at the D_R input is clocked in on the falling edge of the next eight $BCLK_R$ ($BCLK_X$) periods. At the end of the decoder time slot, the decoding cycle begins, and 10 μs later the decoder DAC output is updated. The total decoder delay is ~ 10 μs (decoder update) plus 110 μs (filter delay) plus 62.5 μs (1/2 frame), which gives approximately 180 μs.

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V_{CC}	V_{CC} to GNDA	7	V
V_{BB}	V_{BB} to GNDA	− 7	V
V_{IN}, V_{OUT}	Voltage at Any Analog Input or Output	V_{CC} + 0.3 to V_{BB} − 0.3	V
	Voltage at Any Digital Input or Output	V_{CC} + 0.3 to GNDA − 0.3	V

	f = 4 kHz – 25 kHz	40	–	–	dB
	f = 25 kHz – 50 KHZ	36	–	–	dB
$NPSR_R$	Negative Power Supply Rejection, Receive (PCM code equals positive zero, $V_{BB} = -5.0\ V_{DC} + 100$ mVrms)				
	f = 0 Hz – 4000 Hz	40	–	–	dBp
	f = 4 kHz – 25 kHz	40	–	–	dB
	f = 25 kHz – 50 kHz	36	–	–	dB

TRANSMISSION CHARACTERISTICS (continued)

Symbol	Parameter	Min.	Typ.	Max.	Unit
SOS	Spurious out-of band signals at the channel output. Loop around measurement, 0 dBm0, 300 Hz – 3400 Hz input applied to VF_XI^*, measure individual image signals at VF_R0				dB
	4600 Hz – 7600 Hz	–	–	– 32	
	7600 Hz – 8400 Hz	–	–	– 40	
	8400 Hz – 100,000 Hz	–	–	– 32	

DISTORTION

Symbol	Parameter		Min.	Typ.	Max.	Unit
STD_X or STD_R	Signal to Total Distortion (sinusoidal test method) Transmit or Receive Half-channel					dBp
	Level = 3 dBm0		33	–	–	
	= 0 dBm0 to – 30 dBm0		36	–	–	
	= – 40 dBm0	XMT	29	–	–	
		RCV	30	–	–	
	= – 55 dBm0	XMT	14	–	–	
		RCV	15	–	–	
SFD_X	Single Frequency Distortion, Transmit		–	–	– 46	dB
SFD_R	Single Frequency Distortion, Receive		–	–	– 46	dB
IMD	Intermodulation Distortion Loop Around Measurement, VF_XI^* = – 4 dBm0 to – 21 dBm0, Two Frequencies in the Range 300 Hz – 3400 Hz		–	–	– 41	dB

CROSSTALK

Symbol	Parameter	Min.	Typ.	Max.	Unit
CT_{X-R}	Transmit to Receive Crosstalk, 0 dBm0 Transmit Level f = 300 Hz – 3400 Hz, D_R = Steady PCM Mode	–	–	– 65	dB
CT_{R-X}	Receive to Transmit Crosstalk, 0 dBm0 Receive Level f = 300 Hz – 3400 Hz, VF_XI = 0 V	–	–	– 65 (note 2)	dB

Notes : 1. Measured by extrapolation from the distortion test result.
2. $CT_{R\,X}$ is measured with a – 40 dBm0 activating signal applied at VF_XI^*.

ENCODING FORMAT AT D_X OUTPUT

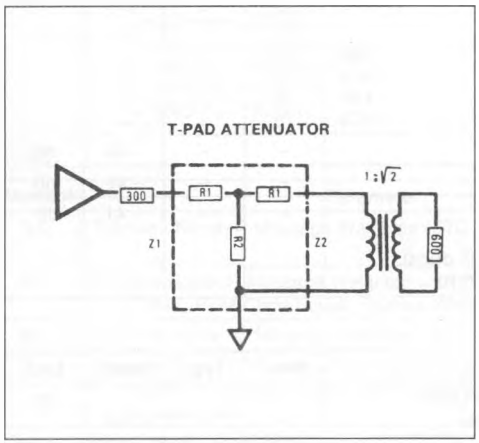
	A–Law (includes even bit inversion)	µLaw
V_{IN} (at GS_X) = + Full-scale	1 0 1 0 1 0 1 0	1 0 0 0 0 0 0 0
V_{IN} (at GS_X) = 0 V	1 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1	1 1 1 1 1 1 1 1 0 1 1 1 1 1 1 1
V_{IN} (at GS_X) = – Full-scale	0 0 1 0 1 0 1 0	0 0 0 0 0 0 0 0

APPLICATIONS INFORMATION

POWER SUPPLIES

While the pins of the ETC5050 family are well protected against electrical misuse, it is recommended that the standard CMOS practice be followed, ensuring that ground is connected to the device before any other connections are made. In applications where the printed circuit board may be plugged into a "hot" socket with power and clocks already present, an extra long ground pin in the connector is useful.

All ground connections to each device should meet at a common point as close as possible to the GNDA pin.



$$R1 = Z1 \left(\frac{N^2+1}{N^2-1}\right) - 2 \quad Z1.Z2\left(\frac{N}{N^2-1}\right)$$

$$R2 = 2\sqrt{Z1.Z2}\left(\frac{N}{N2-1}\right)$$

Where : $N = \sqrt{\frac{\text{POWER IN}}{\text{POWER OUT}}}$

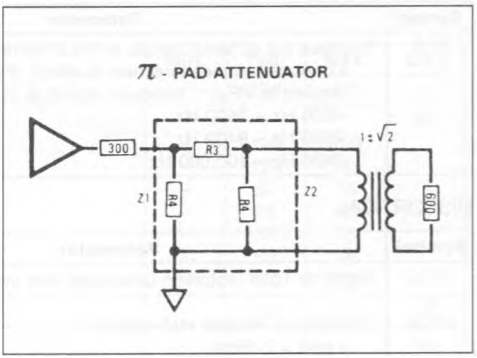
and :

$$S = \sqrt{\frac{Z1}{Z2}}$$

Also : $Z = \sqrt{Z_{SC} \cdot Z_{OC}}$

Where Z_{SC} = impedance with short circuit termination

and Z_{OC} = impedance with open circuit termination.



$$R3 = \sqrt{\frac{Z1.Z2}{2}}\left(\frac{N^2-1}{N}\right)$$

$$R4 = Z1\left(\frac{N^2-1}{N^2-2\,NS+1}\right)$$

This minimizes the interaction of ground return currents flowing through a common bus impedance. 0.1 µF supply decoupling capacitors should be connected from this common ground point to V_{CC} and V_{BB}.

For best performance, the ground point of beach/FILTER on a card should be connected to a common card. This common ground point should be decoupled to V_{CC} and V_{BB} with 10 µF capacitors.

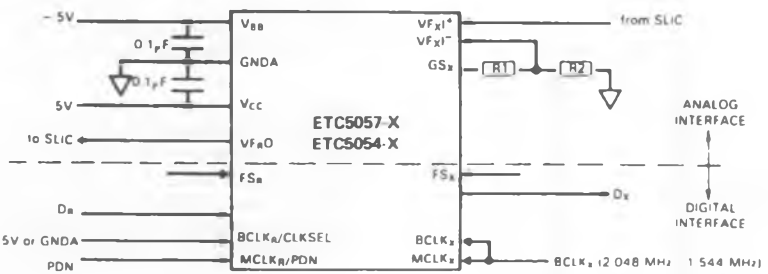
RECEIVE GAIN ADJUSTMENT

For applications where a ETC5050 family CODEC/filter receive output must drive a 600 Ω load, but a peak swing lower then ± 2.5 V is required. the receive gain can be easily adjusted by inserting a matched T-pad or π-pad at the output. Table II lists the required resistor values for 600 Ω terminations. As these are generally non-standard values, the equations can be used to compute the attenuation of the closest pratical set of resistors. It may be necessary to use unequal values for the R1 or R4 arms of the attenuators to achieve a precise attenuation. Generally it is tolerable to allow a small deviation of the input impedance from nominal while still maintaining a good return loss. For example a 30 dB return loss against 600 Ω is obtained if the output impedance of the attenuator is in the range 282 Ω to 319 Ω (assuming a perfect transformer).

Table 2 : Attenuator Tables for Z1 = Z2 = 300 Ω (all values in Ω).

dB	R1	R2	R3	R4
0.1	1.7	26 k	3.5	52 k
0.2	3.5	13 k	6.9	26 k
0.3	5.2	8.7 k	10.4	17.4 k
0.4	6.9	6.5 k	13.8	13 k
0.5	8.5	5.2 k	17.3	10.5 k
0.6	10.4	4.4 k	21.3	8.7 k
0.7	12.1	3.7 k	24.2	7.5 k
0.8	13.8	3.3 k	27.7	6.5 k
0.9	15.5	2.9 k	31.1	5.8 k
1.0	17.3	2.6 k	34.6	5.2 k
2	34.4	1.3 k	70	2.6 k
3	51.3	850	107	1.8 k
4	68	650	144	1.3 k
5	84	494	183	1.1 k
6	100	402	224	900
7	115	380	269	785
8	129	284	317	698
9	143	244	370	630
10	156	211	427	527
11	168	184	490	535
12	180	161	550	500
13	190	142	635	473
14	200	125	720	450
15	210	110	816	430
16	218	98	924	413
18	233	77	1.17 k	386
20	246	61	1.5 k	366

Figure 5 : Typical Synchronous Application.



Note 1 : XMIT gain = 20 X log $\left(\frac{R1 + R2}{R2}\right)$ (R1 + R2) > 10 kΩ.
