RM46Lx30 16/32-Bit RISC Flash Microcontroller

1 RM46Lx30 16/32-Bit RISC Flash Microcontroller

1.1 Features

- **High-Performance Microcontroller for Safety Critical Applications**
  - **Dual CPUs running in lockstep**
  - **ECC on flash and RAM interfaces**
  - **Built-In Self Test for CPU and on-chip RAMs**
  - **Error Signaling Module with Error Pin**
  - **Voltage and Clock Monitoring**
- **ARM® Cortex™ – R4F 32-bit RISC CPU**
  - **1.66DMIPS/MHz with 8-stage pipeline**
  - **FPU with Single/Double Precision**
  - **12-Region Memory Protection Unit**
  - **Open Architecture with 3rd Party Support**
- **Operating Conditions**
  - **200MHz System Clock**
  - **Core Supply Voltage (VCC): 1.14V - 1.32V**
  - **I/O Supply Voltage (VCCIO): 3.0V - 3.6V**
- **Integrated Memory**
  - **Up to 1.25MB Program Flash with ECC**
  - **Up to 192KB RAM with ECC**
  - **64KB Flash for emulated EEPROM with ECC**
- **16- bit External Memory Interface (EMIF)**
- **Common Platform Architecture**
  - **Consistent memory map across family**
  - **Real-Time Interrupt Timer (RTI) OS Timer**
  - **128-channel Vectored Interrupt Module (VIM)**
  - **2-channel Cyclic Redundancy Checker (CRC)**
- **Direct Memory Access (DMA) Controller**
  - **16 Channels and 32 Control Packets**
  - **Parity protection for control packet RAM**
  - **DMA Accesses Protected by Dedicated MPU**
- **Frequency-Modulated Phase-Locked-Loop (FMPLL) with Built-In Slip Detector**
- **Separate Non-Modulating PLL**
- **IEEE 1149.1 JTAG, Boundary Scan and ARM CoreSight Components**
- **Advanced JTAG Security Module (AJSM)**
- **Trace and Calibration Capabilities**
  - **Parameter Overlay Module (POM)**
- **Enhanced Timing Peripherals for Motor Control**
  - **7 Enhanced Pulse Width Modulators (ePWM)**
  - **6 Enhanced Capture (eCAP)**
  - **2 Enhanced Quadrature Encoder Pulse (eQEP)**

- **Two High-End Timer Modules (N2HET)**
  - **N2HET1: 32 programmable channels**
  - **N2HET2: 18 programmable channels**
  - **160 Word Instruction RAM with parity protection each**
  - **Each includes Hardware Angle Generator**
  - **Dedicated Transfer Units (HTU) on N2HETs**
- **Two 10/12-bit Multi-Buffered ADC Modules**
  - **ADC1: 24 channels**
  - **ADC2: 16 channels**
  - **16 shared channels**
  - **64 result buffers with parity protection each**
- **Multiple Communication Interfaces**
  - **USB (revision 2.0 full-speed)**
    - **2-port USB Specification, revision 2.0-compatible host controller, based on the OHCI Specification for USB, release 1.0**
    - **USB device compatible with the USB Specification, revision 2.0 and USB Specification, revision 1.1**
  - **Three CAN Controllers (DCAN)**
    - **64 mailboxes with parity protection each**
    - **Compliant to CAN protocol version 2.0A/B**
  - **Inter-Integrated Circuit (I²C)**
  - **Three Multi-buffered Serial Peripheral Interfaces (MibSPI)**
    - **128 Words with Parity Protection each**
    - **8 Transfer groups**
  - **Up to two Standard Serial Peripheral Interfaces (SPI)**
  - **Two UART (SCI) interfaces, one with Local Interconnect Network Interface (LIN 2.1) Support**
- **Up to 101 general purpose I/O (GIO) capable pins**
  - **16 dedicated GIO pins with interrupt generation capability**
- **Packages**
  - **144-pin Quad Flatpack (PGE) [Green]**
  - **337-Ball Grid Array (ZWT) [Green]**

PRODUCT PREVIEW

⚠ Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

1.2 Applications

- **Industrial Safety Applications**
  - **Industrial Automation**
  - **Safe PLC's (Programmable Logic Controllers)**
  - **Power Generation and Distribution**
  - **Turbines and Windmills**
  - **Elevators and Escalators**
- **Medical Applications**
  - **Ventilators**
  - **Defibrillators**
  - **Infusion and Insulin pumps**
  - **Radiation therapy**
  - **Robotic surgery**

PRODUCT PREVIEW

1.3   Description

The RM46Lx30 is a high performance microcontroller family for safety systems. The safety architecture includes Dual CPUs in lockstep, CPU and Memory Built-In Self Test (BIST) logic, ECC on both the Flash and the data SRAM, parity on peripheral memories, and loop back capability on peripheral IOs.

The RM46Lx30 integrates the ARM® Cortex™-R4F Floating Point CPU which offers an efficient 1.66DMIPS/MHz, and has configurations which can run up to 200MHz providing up to 332 DMIPS. The device supports the big-endian [BE32] format.

The RM46Lx30 has up to 1.25MB integrated Flash and up to 192KB data RAM configurations with single bit error correction and double bit error detection. The flash memory on this device is a nonvolatile, electrically erasable and programmable, implemented with a 64-bit-wide data bus interface. The flash operates on a 3.3V supply input (same level as I/O supply) for all read, program and erase operations. When in pipeline mode, the flash operates with a system clock frequency of up to 200MHz. The SRAM supports single-cycle read/write accesses in byte, halfword, and word modes throughout the supported frequency range..

The RM46Lx30 device features peripherals for real-time control-based applications, including two Next Generation High End Timer (N2HET) timing coprocessors with up to 44 total IO terminals, seven Enhanced PWM (ePWM) modules with up to 14 outputs, six Enhanced Capture Modules (eCAP), two Enhanced Quadrature Encoders (eQEP) and two 12-bit Analog-to-Digital converters supporting up to 24 inputs.

The N2HET is an advanced intelligent timer that provides sophisticated timing functions for real-time applications. The timer is software-controlled, using a reduced instruction set, with a specialized timer micromachine and an attached I/O port. The N2HET can be used for pulse width modulated outputs, capture or compare inputs, or general-purpose I/O. It is especially well suited for applications requiring multiple sensor information and drive actuators with complex and accurate time pulses. A High End Timer Transfer Unit (HET-TU) can perform DMA type transactions to transfer N2HET data to or from main memory. A Memory Protection Unit (MPU) is built into the HET-TU.

The enhanced pulse width modulator (ePWM) module is able to generate complex pulse width waveforms with minimal CPU overhead or intervention. It is easy to use and supports both high side and low side PWM and deadband generation. With integrated trip zone protection and synchronization with the on chip MibADC, the ePWM module is ideal for digital motor control applications.

The enhanced Capture (eCAP) module is essential in systems where the accurately timed capture of external events is important. The eCAP can also be used to monitor the ePWM outputs or for simple PWM generation when not needed for capture applications.

The enhanced quadrature encoder pulse (eQEP) module is used for direct interface with a linear or rotary incremental encoder to get position, direction, and speed information from a rotating machine as used in high-performance motion and position-control systems.

The device has two 12-bit-resolution MibADCs with 24 total channels and 64 words of parity protected buffer RAM each. The MibADC channels can be converted individually or can be grouped by software for sequential conversion sequences. Sixteen channels are shared between the two MibADCs. There are three separate groups. Each group can be converted once when triggered or configured for continuous conversion mode.

The device has multiple communication interfaces: three MibSPIs, two SPIs, one LIN, one SCI, three DCANs, one I^{2}C, and one USB module.. The SPI provides a convenient method of serial interaction for high-speed communications between similar shift-register type devices. The LIN supports the Local Interconnect standard 2.0 and can be used as a UART in full-duplex mode using the standard Non-Return-to-Zero (NRZ) format. The DCAN supports the CAN 2.0B protocol standard and uses a serial,

PRODUCT PREVIEW

multimaster communication protocol that efficiently supports distributed real-time control with robust communication rates of up to 1 megabit per second (Mbps). The DCAN is ideal for applications operating in noisy and harsh environments (e.g., automotive and industrial fields) that require reliable serial communication or multiplexed wiring. The USB module includes a 2-port USB host controller and a USB device controller

The I2C module is a multi-master communication module providing an interface between the microcontroller and an I2C compatible device via the I2C serial bus. The I2C supports both 100 Kbps and 400 Kbps speeds.

A frequency-modulated phase-locked loop (FMPLL) clock module is used to multiply the external frequency reference to a higher frequency for internal use. The FMPLL provides one of the seven possible clock source inputs to the global clock module (GCM). The GCM module manages the mapping between the available clock sources and the device clock domains.

The device also has an external clock prescaler (ECP) module that when enabled, outputs a continuous external clock on the ECLK terminal. The ECLK frequency is a user-programmable ratio of the peripheral interface clock (VCLK) frequency. This low frequency output can be monitored externally as an indicator of the device operating frequency.

The Direct Memory Access Controller (DMA) has 16 channels, 32 control packets and parity protection on its memory. A Memory Protection Unit (MPU) is built into the DMA to protect memory against erroneous transfers.

The Error Signaling Module (ESM) monitors all device errors and determines whether an interrupt or external Error pin/ball is triggered when a fault is detected. The nERROR terminal can be monitored externally as an indicator of a fault condition in the microcontroller.

The External Memory Interface (EMIF) provides a memory extension to asynchronous and synchronous memories or other slave devices.

A Parameter Overlay Module (POM) is included to enhance the calibration capabilities of application code. The POM can re-route Flash accesses to internal memory or to the EMIF, thus avoiding the re-programming steps necessary for parameter updates in Flash.

With integrated safety features and a wide choice of communication and control peripherals, the RM46Lx30 is an ideal solution for high performance real time control applications with safety critical requirements.

Device Package and Terminal Functions   9

2.3 Terminal Functions

Section 2.3.1 and Section 2.3.2 identify the external signal names, the associated pin/ball numbers along with the mechanical package designator, the pin/ball type (Input, Output, IO, Power or Ground), whether the pin/ball has any internal pullup/pulldown, whether the pin/ball can be configured as a GIO, and a functional pin/ball description. The first signal name listed is the primary function for that terminal. The signal name in Bold is the function being described. Refer to the I/O Multiplexing Module (IOMM) User Guide for information on how to select between different multiplexed functions.

NOTE

All I/O signals except nRST are configured as inputs while nPORRST is low and immediately after nPORRST goes High.

All output-only signals are configured as inputs while nPORRST is low, and are configured as outputs immediately after nPORRST goes High.

While nPORRST is low, the input buffers are disabled, and the output buffers are tri-stated.

2.3.1 PGE Package

2.3.1.1 Multi-Buffered Analog-to-Digital Converters (MibADC)

2.3.1.6 General-Purpose Input / Output (GIO)

Table 2-6. PGE General-Purpose Input / Output (GIO)

Terminal		Signal Type	Default Pull State	Pull Type	Description
Signal Name	144 PGE				
GIOA[0]/USB2.VP/USB_FUNC.RXDPI	2	I/O	Pull Down	Programmable, 20uA	General-purpose I/O. All GIO terminals are capable of generating interrupts to the CPU on rising / falling / both edges.
GIOA[1]/USB2.VM/USB_FUNC.RXDMI	5				
GIOA[2]/USB2.TXDAT/USB_FUNC.TXDO/N2HET2[0]/EQEP2II	9				
GIOA[5]/EXTCLKIN/EPWM1A/N2HET1_PIN_nDIS	14				
GIOA[6]/N2HET2[4]/EPWM1B	16				
GIOA[7]/N2HET2[6]/EPWM2A	22				
GIOB[0]/USB1.TXDAT	126				
GIOB[1]/USB1.PortPower	133				
GIOB[2]	142				
MIBSPI3NCS[0]/AD2EVT/**GIOB[2]**/EQEP1I/N2HET2_PIN_nDIS	55[1]		Pull Up		
GIOB[3]USB2.RCV/USB_FUNC.RXDI	1		Pull Down		

(1) GIOB[2] cannot output a level on to pin 55. Only the input functionality is supported so that the application can generate an interrupt whenever the N2HET2_PIN_nDIS is asserted (driven low). Also, a pull up is enabled on the input. This is not programmable using the GIO module control registers.

2.3.1.7 Controller Area Network Controllers (DCAN)

Table 2-7. PGE Controller Area Network Controllers (DCAN)

Terminal		Signal Type	Default Pull State	Pull Type	Description
Signal Name	144 PGE

2.3.1.14 System Module Interface

Table 2-15. PGE System Module Interface

Terminal		Signal Type	Default Pull State	Pull Type	Description
Signal Name	144 PGE				
nPORRST	46	Input	Pull Down	100uA	Power-on reset, cold reset External power supply monitor circuitry must drive nPORRST low when any of the supplies to the microcontroller fall out of thespecified range. This terminal has a glitch filter. See Section 4.8.
nRST	116	I/O	Pull Up	100uA	System reset, warm reset, bidirectional. The internal circuitry indicates any reset condition by driving nRST low. The external circuitry can assert a system reset by driving nRST low. To ensure that an external reset is not arbitrarily generated, TI recommends that an external pull-up resistor is connected to this terminal. This terminal has a glitch filter. See Section 4.8.
nERROR	117	I/O	Pull Down	20uA	ESM Error Signal Indicates error of high severity. See Section 4.18.

2.3.1.15 Clock Inputs and Outputs

Table 2-16. PGE Clock Inputs and Outputs

Terminal		Signal Type	Default Pull State	Pull Type	Description
Signal Name	144 PGE				
OSCIN	18	Input	-	-	From external crystal/resonator, or external clock input
KELVIN_GND	19	Input			Kelvin ground for oscillator
OSCOUT	20	Output			To external crystal/resonator
ECLK	119	I/O	Pull Down	Programmable, 20uA	External prescaled clock output, or GIO.

MIBSPI3NCS[2]/I2C_SDA/N2HET1[27]/**nTZ2**	B2				
N2HET1[10]/USB1.TXEN//**nTZ3**	D19		Pull Down		

2.3.2.6   General-Purpose Input / Output (GIO)

Table 2-27. ZWT General-Purpose Input / Output (GIO)

Terminal		Signal Type	Default Pull State	Pull Type	Description
Signal Name	**337 ZWT**				
GIOA[0]/USB2.VP/USB_FUNC.RXDPI	A5	I/O	Pull Down	Programmable, 20uA	General-purpose I/O. All GIO terminals are capable of generating interrupts to the CPU on rising / falling / both edges.
GIOA[1]/USB2.VM/USB_FUNC.RXDMI	C2				
GIOA[2]/USB2.TXDAT/USB_FUNC.TXDO/N2HET2[0] /EQEP2I	C1				
GIOA[3]/N2HET2[2]	E1				
GIOA[4]	A6				
GIOA[5]/EXTCLKIN/EPWM1A/N2HET1_PIN_nDIS	B5				
GIOA[6]/N2HET2[4]/EPWM1B	H3				
GIOA[7]/N2HET2[6]/EPWM2A	M1				
GIOB[0]/USB1.TXDAT	M2				
GIOB[1]/USB1.PortPower	K2				
GIOB[2]	F2 / V10[(1)]				
GIOB[3]/USB2.RCV	W10				
GIOB[4]	G1				
GIOB[5]	G2				
GIOB[6]	J2				
GIOB[7]	F1				

(1)   GIOB[2] cannot output a level on to terminal V10. Only the input functionality is supported so that the application can generate an interrupt whenever the N2HET2_PIN_nDIS is asserted (driven low). Also, a pull up is enabled on the input. This is not programmable using the GIO module control registers.

2.3.2.14 External Memory Interface (EMIF)

Table 2-36. External Memory Interface (EMIF)

Terminal		Signal Type	Default Pull State	Pull Type	Description
Signal Name	337 ZWT				
EMIF_CKE	L3	Output	Pull Down	-	EMIF Clock Enable
EMIF_CLK	K3	I/O			EMIF clock. This is an output signal in functional mode. It is gated off by default, so that the signal is tri-stated. PINMUX29[8] must be cleared to enable this output.
EMIF_nWE/**EMIF_RNW**	D17	Output	Pull Up	-	EMIF Read-Not-Write
EMIF_nOE	E12		Pull Down	-	EMIF Read Enable
EMIF_nWAIT	P3	I/O	Pull Up	Fixed, 20uA	EMIF Extended Wait Signal
EMIF_nWE/EMIF_RNW	D17	Output	Pull Up	Programmable, 20uA	EMIF Write Enable.
EMIF_nCAS	R4	Output			EMIF column address strobe
EMIF_nRAS	R3	Output			EMIF row address strobe
EMIF_nCS[0]/N2HET2[7][1]	N17	Output	Pull Down		EMIF chip select, synchronous
EMIF_nCS[2]	L17	Output	Pull Up		EMIF chip selects, asynchronous This applies to chip selects 2, 3 and 4
EMIF_nCS[3]/N2HET2[9][1]	K17	Output	Pull Down		
EMIF_nCS[4]	M17	Output	Pull Up		
EMIF_nDQM[0]	E10	Output	Pull Down	Programmable, 20uA	EMIF Data Mask or Write Strobe. Data mask for SDRAM devices, write strobe for connected asynchronous devices.
EMIF_nDQM[1]	E11	Output			
EMIF_BA[0]	E13	Output			EMIF bank address or address line
EMIF_BA[1]/N2HET2[5][1]	D16	Output			EMIF bank address or address line
EMIF_ADDR[0]/N2HET2[1][1]	D4	Output			EMIF address
EMIF_ADDR[1]/N2HET2[3][1]	D5	Output			
EMIF_ADDR[2]	E6	Output			
EMIF_ADDR[3]	E7	Output			
EMIF_ADDR[4]	E8	Output			
EMIF_ADDR[5]	E9	Output			
EMIF_ADDR[6]/NHET2[11][1]	C4	Output			
EMIF_ADDR[7]/NHET2[13][1]	C5	Output			
EMIF_ADDR[8]/NHET2[15][1]	C6	Output			
EMIF_ADDR[9]	C7	Output			
EMIF_ADDR[10]	C8	Output			
EMIF_ADDR[11]	C9	Output			
EMIF_ADDR[12]	C10	Output			

(1) These signals are tri-stated and pulled down by default after power-up. Any application that requires the EMIF must set the bit 31 of the system module general-purpose register GPREG1.

2.3.2.15 System Module Interface

Table 2-37. ZWT System Module Interface

Terminal		Signal Type	Default Pull State	Pull Type	Description
Signal Name	**337 ZWT**				
nPORRST	W7	Input	Pull Down	100uA	Power-on reset, cold reset External power supply monitor circuitry must drive nPORRST low when any of the supplies to the microcontroller fall out of thespecified range. This terminal has a glitch filter. See Section 4.8.
nRST	B17	I/O	Pull Up	100uA	System reset, warm reset, bidirectional. The internal circuitry indicates any reset condition by driving nRST low. The external circuitry can assert a system reset by driving nRST low. To ensure that an external reset is not arbitrarily generated, TI recommends that an external pull-up resistor is connected to this terminal. This terminal has a glitch filter. See Section 4.8.
nERROR	B14	I/O	Pull Down	20uA	ESM Error Signal Indicates error of high severity. See Section 4.18.

2.3.2.16 Clock Inputs and Outputs

Table 2-38. ZWT Clock Inputs and Outputs

Terminal		Signal Type	Default Pull State	Pull Type	Description
Signal Name	**337 ZWT**				
OSCIN	K1	Input	-	-	From external crystal/resonator, or external clock input
KELVIN_GND	L2	Input			Kelvin ground for oscillator
OSCOUT	L1	Output			To external crystal/resonator
ECLK	A12	I/O	Pull Down	Programmable, 20uA	External prescaled clock output, or GIO.
GIOA[5]/**EXTCLKIN**/EPWM1A/N2HET1_PIN_nDIS	B5	Input	Pull Down	20uA	External clock input #1
EXTCLKIN2	R9	Input			External clock input #2
VCCPLL	P11	1.2V Power		-	Dedicated core supply for PLL's

3 Device Operating Conditions

3.1 Absolute Maximum Ratings Over Operating Free-Air Temperature Range, [1]

Supply voltage range:	V_{CC}[2]	-0.3 V to 1.43 V
	V_{CCIO}, V_{CCP}[2]	-0.3 V to 4.1 V
	V_{CCAD}	-0.3 V to 5.5 V
Input voltage range:	All input pins, with exception of ADC pins	-0.3 V to 4.1 V
	ADC input pins	-0.3 V to 5.25 V
Input clamp current:	I_{IK} (V_I < 0 or V_I > V_{CCIO}) All pins, except AD1IN[23:0]	±20 mA
	I_{IK} (V_I < 0 or V_I > V_{CCAD}) AD1IN[23:0]	±10 mA
	Total	±40 mA
Operating free-air temperature range, T_A:		-40°C to 105°C
Operating junction temperature range, T_J:		-40°C to 150°C
Storage temperature range, T_{stg}		-65°C to 150°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) maximum-rated conditions for extended periods may affect device reliability. All voltage values are with respect to their associated grounds.

3.2 Device Recommended Operating Conditions[1]

		MIN	NOM	MAX	UNIT
V_{CC}	Digital logic supply voltage (Core)	1.14	1.2	1.32	V
V_{CCPLL}	PLL Supply Voltage	1.14	1.2	1.32	V
V_{CCIO}	Digital logic supply voltage (I/O)	3	3.3	3.6	V
V_{CCAD}	MibADC supply voltage	3		5.25	V
V_{CCP}	Flash pump supply voltage	3	3.3	3.6	V
V_{SS}	Digital logic supply ground		0		V
V_{SSAD}	MibADC supply ground	-0.1		0.1	V
$V_{ADREFHI}$	A-to-D high-voltage reference source	V_{SSAD}		V_{CCAD}	V
$V_{ADREFLO}$	A-to-D low-voltage reference source	V_{SSAD}		V_{CCAD}	V
T_A	Operating free-air temperature	-40		105	°C
T_J	Operating junction temperature	-40		150	°C

(1) All voltages are with respect to V_{SS}, except V_{CCAD}, which is with respect to V_{SSAD}

3.3 Switching Characteristics over Recommended Operating Conditions for Clock Domains

Table 3-1. Clock Domain Timing Specifications

Parameter	Description		Conditions	Max	Unit
f_{HCLK}	HCLK - System clock frequency		Pipeline mode enabled	200	MHz
			Pipeline mode disabled	50	MHz
f_{GCLK}	GCLK - CPU clock frequency			f_{HCLK}	MHz
f_{VCLK}	VCLK - Primary peripheral clock frequency			100	MHz
f_{VCLK2}	VCLK2 - Secondary peripheral clock frequency			100	MHz
f_{VCLK3}	VCLK3 - Secondary peripheral clock frequency			100	MHz
f_{VCLKA1}	VCLKA1 - Primary asynchronous peripheral clock frequency			100	MHz
f_{VCLKA2}	VCLKA2 - Secondary asynchronous peripheral clock frequency			100	MHz
f_{VCLKA3}	VCLKA3 - Primary asynchronous peripheral clock frequency			100	MHz
f_{VCLKA4}	VCLKA4 - Secondary asynchronous peripheral clock frequency			100	MHz
f_{RTICLK}	RTICLK - clock frequency			f_{VCLK}	MHz

3.4 Wait States Required

RAM

Address Waitstates — 0 (0MHz – 200MHz)

Data Waitstates — 0 (0MHz – 200MHz)

Flash

Address Waitstates — 0 (0MHz – 120MHz), 1 (120MHz – 200MHz)

Data Waitstates — 0 (0MHz – 50MHz), 1 (50MHz – 100MHz), 2 (100MHz – 150MHz), 3 (150MHz – 200MHz)
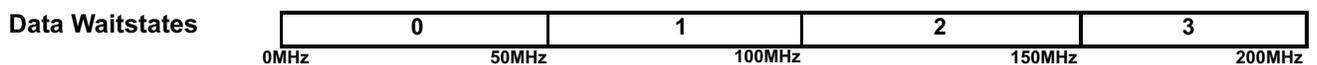

Figure 3-1. Wait States Scheme

As shown in the figure above, the TCM RAM can support program and data fetches at full CPU speed without any address or data wait states required.

The TCM flash can support zero address and data wait states up to a CPU speed of 50MHz in non-pipelined mode.

The flash wrapper defaults to non-pipelined mode with zero address wait state and one random-read data wait state.

3.5 Power Consumption Over Recommended Operating Conditions

PARAMETER			TEST CONDITIONS	MIN	TYP	MAX	UNIT

PRODUCT PREVIEW

3.10 Low-EMI Output Buffers

The low-EMI output buffer has been designed explicitly to address the issue of decoupling sources of emissions from the pins which they drive. This is accomplished by adaptively controlling the impedance of the output buffer, and is particularly effective with capacitive loads.

This is not the default mode of operation of the low-EMI output buffers and must be enabled by setting the system module GPCR1 register for the desired module or signal, as shown in Table 3-6. The adaptive impedance control circuit monitors the DC bias point of the output signal. The buffer internally generates two reference levels, VREFLOW and VREFHIGH, which are set to approximately 10% and 90% of VCCIO, respectively.

Once the output buffer has driven the output to a low level, if the output voltage is below VREFLOW, then the output buffer's impedance will increase to hi-Z. A high degree of decoupling between the internal ground bus and the output pin will occur with capacitive loads, or any load in which no current is flowing, e.g. the buffer is driving low on a resistive path to ground. Current loads on the buffer which attempt to pull the output voltage above VREFLOW will be opposed by the buffer's output impedance so as to maintain the output voltage at or below VREFLOW.

Conversely, once the output buffer has driven the output to a high level, if the output voltage is above VREFHIGH then the output buffer's impedance will again increase to hi-Z. A high degree of decoupling between internal power bus ad output pin will occur with capacitive loads or any loads in which no current is flowing, e.g. buffer is driving high on a resistive path to VCCIO. Current loads on the buffer which attempt to pull the output voltage below VREFHIGH will be opposed by the buffer's output impedance so as to maintain the output voltage at or above VREFHIGH.

The bandwidth of the control circuitry is relatively low, so that the output buffer in adaptive impedance control mode cannot respond to high-frequency noise coupling into the buffer's power buses. In this manner, internal bus noise approaching 20% peak-to-peak of VCCIO can be rejected.

Unlike standard output buffers which clamp to the rails, an output buffer in impedance control mode will allow a positive current load to pull the output voltage up to VCCIO + 0.6V without opposition. Also, a negative current load will pull the output voltage down to VSSIO – 0.6V without opposition. This is not an issue since the actual clamp current capability is always greater than the IOH / IOL specifications.

The low-EMI output buffers are automatically configured to be in the standard buffer mode when the device enters a low-power mode.

Table 3-6. Low-EMI Output Buffer Hookup

Module or Signal Name	Control Register to Enable Low-EMI Mode

Signal: TEST	GPREG1.12
Signal: nERROR	GPREG1.13
Signal: AD1EVT	GPREG1.14

4   System Information and Electrical Specifications

4.1   Device Power Domains

The device core logic is split up into multiple power domains in order to optimize the power for a given application use case. There are 6 core power domains in total: PD1, PD2, PD3, PD5, RAM_PD1, and RAM_PD2. Refer to Section 1.4 for more information.

PD1 is an "always-ON" power domain, which cannot be turned off. Each of the other core power domains can be turned ON/OFF one time during device initialization as per the application requirement. Refer to the Power Management Module (PMM) chapter of the device technical reference manual for more details.

NOTE

The clocks to a module must be turned off before powering down the core domain that contains the module.

NOTE

The logic in the modules that are powered down loses its power completely. Any access to modules that are powered down results in an abort being generated. When power is restored, the modules power-up to their default states (after normal power-up). No register or memory contents are preserved in the core domains that are turned off.

4.2   Voltage Monitor Characteristics

A voltage monitor is implemented on this device. The purpose of this voltage monitor is to eliminate the requirement for a specific sequence when powering up the core and I/O voltage supplies.

4.2.1   Important Considerations

- The voltage monitor does not eliminate the need of a voltage supervisor circuit to guarantee that the device is held in reset when the voltage supplies are out of range.
- The voltage monitor only monitors the core supply (VCC) and the I/O supply (VCCIO). The other supplies are not monitored by the VMON. For example, if the VCCAD or VCCP are supplied from a source different from that for VCCIO, then there is no internal voltage monitor for the VCCAD and VCCP supplies.

4.2.2   Voltage Monitor Operation

The voltage monitor generates the Power Good MCU signal (PGMCU) as well as the I/Os Power Good IO signal (PGIO) on the device. During power-up or power-down, the PGMCU and PGIO are driven low when the core or I/O supplies are lower than the specified minimum monitoring thresholds. The PGIO and PGMCU being low isolates the core logic as well as the I/O controls during the power-up or power-down of the supplies. This allows the core and I/O supplies to be powered up or down in any order.

When the voltage monitor detects a low voltage on the I/O supply, it will assert a power-on reset. When the voltage monitor detects an out-of-range voltage on the core supply, it asynchronously makes all output pins high impedance, and asserts a power-on reset. The voltage monitor is disabled when the device enters a low power mode.

The VMON also incorporates a glitch filter for the nPORRST input. Refer to Section 4.3.3.1 for the timing information on this glitch filter.

PRODUCT PREVIEW

Table 4-1. Voltage Monitoring Specifications

PARAMETER			MIN	TYP	MAX	UNIT
V_{MON}	Voltage monitoring thresholds	VCC low - VCC level below this threshold is detected as too low.	0.8	0.9	1.0	V
		VCC high - VCC level above this threshold is detected as too high.	1.40	1.7	2.1	
		VCCIO low - VCCIO level below this threshold is detected as too low.	1.9	2.4	2.9	

4.2.3 Supply Filtering

The VMON has the capability to filter glitches on the VCC and VCCIO supplies.

The following table shows the characteristics of the supply filtering. Glitches in the supply larger than the maximum specification cannot be filtered.

Table 4-2. VMON Supply Glitch Filtering Capability

Parameter	MIN	MAX
Width of glitch on VCC that can be filtered	250ns	1us
Width of glitch on VCCIO that can be filtered	250ns	1us

PRODUCT PREVIEW

4.3 Power Sequencing and Power On Reset

4.3.1 Power-Up Sequence

There is no timing dependency between the ramp of the VCCIO and the VCC supply voltage. The power-up sequence starts with the I/O voltage rising above the minimum I/O supply threshold, (see Table 4-4 for more details), core voltage rising above the minimum core supply threshold and the release of power-on reset. The high frequency oscillator will start up first and its amplitude will grow to an acceptable level. The oscillator start up time is dependent on the type of oscillator and is provided by the oscillator vendor. The different supplies to the device can be powered up in any order.

The device goes through the following sequential phases during power up.

Table 4-3. Power-Up Phases

Oscillator start-up and validity check	1032 oscillator cycles
eFuse autoload	1160 oscillator cycles
Flash pump power-up	688 oscillator cycles
Flash bank power-up	617 oscillator cycles
Total	**3497 oscillator cycles**

The CPU reset is released at the end of the above sequence and fetches the first instruction from address 0x00000000.

4.3.2 Power-Down Sequence

The different supplies to the device can be powered down in any order.

4.3.3 Power-On Reset: nPORRST

This is the power-on reset. This reset must be asserted by an external circuitry whenever the I/O or core supplies are outside the specified recommended range. This signal has a glitch filter on it. It also has an internal pulldown.

4.3.3.1 nPORRST Electrical and Timing Requirements

Table 4-4. Electrical Requirements for nPORRST

NO	Parameter		MIN	MAX	Unit
	V_{CCPORL}	V_{CC} low supply level when nPORRST must be active during power-up		0.5	V
	V_{CCPORH}	V_{CC} high supply level when nPORRST must remain active during power-up and become active during power down	1.14		V
	$V_{CCIOPORL}$	V_{CCIO} / V_{CCP} low supply level when nPORRST must be active during power-up		1.1	V
	$V_{CCIOPORH}$	V_{CCIO} / V_{CCP} high supply level when nPORRST must remain active during power-up and become active during power down	3.0		V
	$V_{IL(PORRST)}$	Low-level input voltage of nPORRST V_{CCIO} > 2.5V		0.2 * V_{CCIO}	V
		Low-level input voltage of nPORRST V_{CCIO} < 2.5V		0.5	V
3	$t_{su(PORRST)}$	Setup time, nPORRST active before V_{CCIO} and V_{CCP} > $V_{CCIOPORL}$ during power-up	0		ms
6	$t_{h(PORRST)}$	Hold time, nPORRST active after V_{CC} > V_{CCPORH}	1		ms
7	$t_{su(PORRST)}$	Setup time, nPORRST active before V_{CC} < V_{CCPORH} during power down	2		µs
8	$t_{h(PORRST)}$	Hold time, nPORRST active after V_{CCIO} and V_{CCP} > $V_{CCIOPORH}$	1		ms
9	$t_{h(PORRST)}$	Hold time, nPORRST active after V_{CC} < V_{CCPORL}	0		ms

PRODUCT PREVIEW

Table 4-4. Electrical Requirements for nPORRST (continued)

NO	Parameter		MIN	MAX	Unit
	$t_{f(nPORRST)}$	Filter time nPORRST pin; pulses less than MIN will be filtered out, pulses greater than MAX will generate a reset.	500	2000	ns
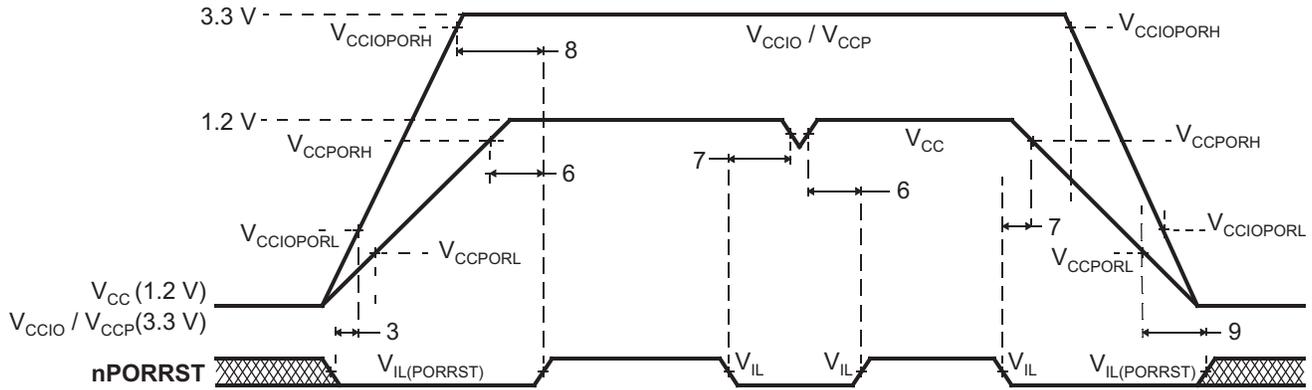

NOTE: There is no timing dependency between the ramp of the VCCIO and the VCC supply voltage; this is just an exemplary drawing.

Figure 4-1. nPORRST Timing Diagram

4.4 Warm Reset (nRST)

This is a bidirectional reset signal. The internal circuitry drives the signal low on detecting any device reset condition. An external circuit can assert a device reset by forcing the signal low. On this terminal, the output buffer is implemented as an open drain (drives low only). To ensure an external reset is not arbitrarily generated, TI recommends that an external pullup resistor is connected to this terminal.

This terminal has a glitch filter. It also has an internal pullup

4.4.1 Causes of Warm Reset

Table 4-5. Causes of Warm Reset

DEVICE EVENT	SYSTEM STATUS FLAG
Power-Up Reset	Exception Status Register, bit 15
Oscillator fail	Global Status Register, bit 0
PLL slip	Global Status Register, bits 8 and 9
Watchdog exception / Debugger reset	Exception Status Register, bit 13
CPU Reset (driven by the CPU STC)	Exception Status Register, bit 5
Software Reset	Exception Status Register, bit 4
External Reset	Exception Status Register, bit 3

4.4.2 nRST Timing Requirements

Table 4-6. nRST Timing Requirements[1]

	PARAMETER	MIN	MAX	UNIT
$t_{v(RST)}$	Valid time, nRST active after nPORRST inactive	$1160\ t_{c(OSC)} + 1048 t_{c(OSC)}$		ns
	Valid time, nRST active (all other System reset conditions)	$8 t_{c(VCLK)}$		
$t_{f(nRST)}$	Filter time nRST pin; pulses less than MIN will be filtered out, pulses greater than MAX will generate a reset	500	2000	ns

(1) Specified values do NOT include rise/fall times. For rise and fall timings, see Table 3-4.

PRODUCT PREVIEW

4.5 ARM© Cortex-R4F™ CPU Information

4.5.1 Summary of ARM Cortex-R4F™ CPU Features

The features of the ARM Cortex-R4F™ CPU include:

- An integer unit with integral EmbeddedICE-RT logic.
- High-speed Advanced Microprocessor Bus Architecture (AMBA) Advanced eXtensible Interfaces (AXI) for Level two (L2) master and slave interfaces.
- Floating Point Coprocessor
- Dynamic branch prediction with a global history buffer, and a 4-entry return stack
- Low interrupt latency.
- Non-maskable interrupt.
- A Harvard Level one (L1) memory system with:
    - Tightly-Coupled Memory (TCM) interfaces with support for error correction or parity checking memories
    - ARMv7-R architecture Memory Protection Unit (MPU) with 12 regions
- Dual core logic for fault detection in safety-critical applications.
- An L2 memory interface:
    - Single 64-bit master AXI interface
    - 64-bit slave AXI interface to TCM RAM blocks
- A debug interface to a CoreSight Debug Access Port (DAP).
- A Performance Monitoring Unit (PMU).
- A Vectored Interrupt Controller (VIC) port.

For more information on the ARM Cortex-R4F™ CPU please see www.arm.com.

4.5.2 ARM Cortex-R4F™ CPU Features Enabled by Software

The following CPU features are disabled on reset and must be enabled by the application if required.

- ECC On Tightly-Coupled Memory (TCM) Accesses
- Hardware Vectored Interrupt (VIC) Port
- Floating Point Coprocessor
- Memory Protection Unit (MPU)

4.5.3 Dual Core Implementation

The device has two Cortex-R4F cores, where the output signals of both CPUs are compared in the CCM-R4 unit. To avoid common mode impacts the signals of the CPUs to be compared are delayed by 2 clock cycles as shown in Figure 4-3.

The CPUs have a diverse CPU placement given by following requirements:

- different orientation; e.g. CPU1 = "north" orientation, CPU2 = "flip west" orientation
- dedicated guard ring for each CPU

North   Flip West

Figure 4-2. Dual - CPU Orientation

Submit Documentation Feedback
Product Folder Links: *RM46L430 RM46L830*

4.5.4 Duplicate clock tree after GCLK

The CPU clock domain is split into two clock trees, one for each CPU, with the clock of the 2nd CPU running at the same frequency and in phase to the clock of CPU1. See Figure 4-3.

4.5.5 ARM Cortex-R4F™ CPU Compare Module (CCM) for Safety

This device has two ARM Cortex-R4F™ CPU cores, where the output signals of both CPUs are compared in the CCM-R4 unit. To avoid common mode impacts the signals of the CPUs to be compared are delayed in a different way as shown in the figure below.
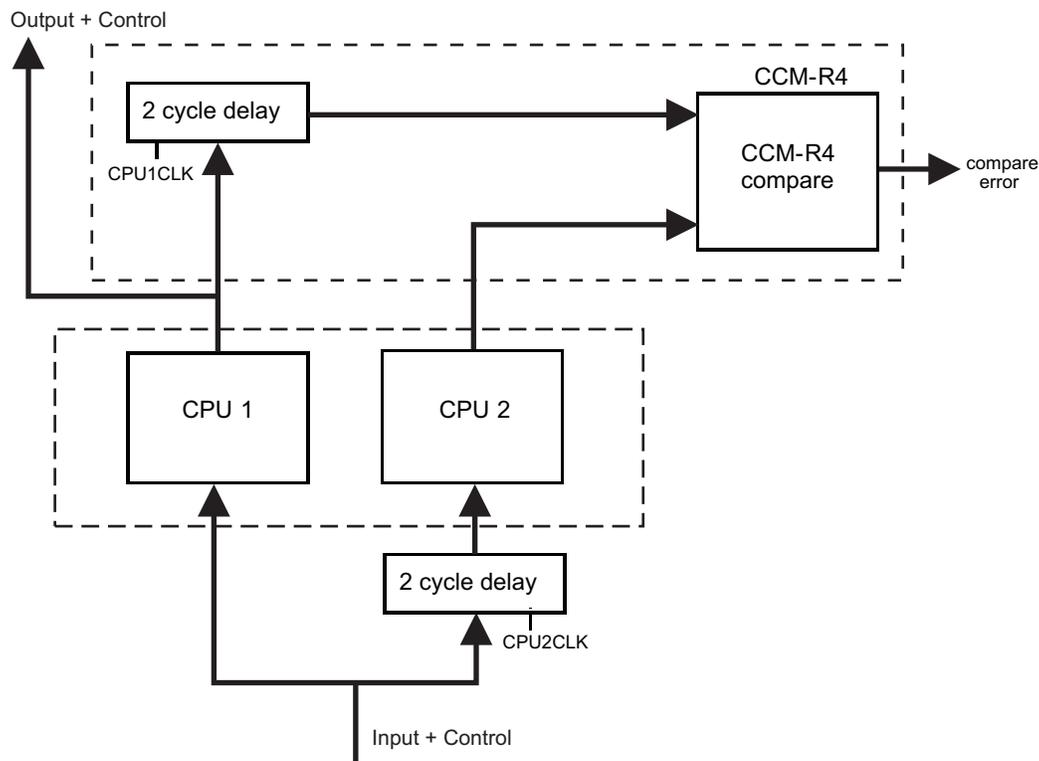

Figure 4-3. Dual Core Implementation

To avoid an erroneous CCM-R4 compare error, the application software must initialize the registers of both CPUs before the registers are used, including function calls where the register values are pushed onto the stack.

4.5.6 CPU Self-Test

The CPU STC (Self-Test Controller) is used to test the two Cortex-R4F CPU Cores using the Deterministic Logic BIST Controller as the test engine.

The main features of the self-test controller are:
- Ability to divide the complete test run into independent test intervals
- Capable of running the complete test as well as running few intervals at a time
- Ability to continue from the last executed interval (test set) as well as ability to restart from the beginning (First test set)
- Complete isolation of the self-tested CPU core from rest of the system during the self-test run
- Ability to capture the Failure interval number
- Timeout counter for the CPU self-test run as a fail-safe feature

PRODUCT PREVIEW

4.5.6.1 Application Sequence for CPU Self-Test

1. Configure clock domain frequencies.
2. Select number of test intervals to be run.
3. Configure the timeout period for the self-test run.
4. Enable self-test.
5. Wait for CPU reset.
6. In the reset handler, read CPU self-test status to identify any failures.
7. Retrieve CPU state if required.

For more information see the device Technical Reference Manual.

4.5.6.2 CPU Self-Test Clock Configuration

The maximum clock rate for the self-test is 100MHz. The STCCLK is divided down from the CPU clock. This divider is configured by the STCCLKDIV register at address 0xFFFFE108.

For more information see the device Technical Reference Manual.

4.5.6.3 CPU Self-Test Coverage

Table 4-7 shows CPU test coverage achieved for each self-test interval. It also lists the cumulative test cycles. The test time can be calculated by multiplying the number of test cycles with the STC clock period.

Table 4-7. CPU Self-Test Coverage

INTERVALS	TEST COVERAGE, %	TEST CYCLES
0	0	0
1	62.13	1365
2	70.09	2730
3	74.49	4095
4	77.28	5460
5	79.28	6825
6	80.90	8190
7	82.02	9555
8	83.10	10920
9	84.08	12285
10	84.87	13650
11	85.59	15015
12	86.11	16380
13	86.67	17745
14	87.16	19110
15	87.61	20475
16	87.98	21840
17	88.38	23205
18	88.69	24570
19	88.98	25935
20	89.28	27300
21	89.50	28665
22	89.76	30030
23	90.01	31395
24	90.21	32760

4.6 Clocks

4.6.1 Clock Sources

The table below lists the available clock sources on the device. Each of the clock sources can be enabled or disabled using the CSDISx registers in the system module. The clock source number in the table corresponds to the control bit in the CSDISx register for that clock source.

The table also shows the default state of each clock source.

Table 4-8. Available Clock Sources

Clock Source #	Name	Description	Default State
0	OSCIN	Main Oscillator	Enabled
1	PLL1	Output From PLL1	Disabled
2	Reserved	Reserved	Disabled
3	EXTCLKIN1	External Clock Input #1	Disabled
4	LFLPO	Low Frequency Output of Internal Reference Oscillator	Enabled
5	HFLPO	High Frequency Output of Internal Reference Oscillator	Enabled
6	PLL2	Output From PLL2	Disabled
7	EXTCLKIN2	External Clock Input #2	Disabled

4.6.1.1 Main Oscillator

The oscillator is enabled by connecting the appropriate fundamental resonator/crystal and load capacitors across the external OSCIN and OSCOUT pins as shown in Figure 4-4. The oscillator is a single stage inverter held in bias by an integrated bias resistor. This resistor is disabled during leakage test measurement and low power modes.

TI strongly encourages each customer to submit samples of the device to the resonator/crystal vendors for validation. The vendors are equipped to determine what load capacitors will best tune their resonator/crystal to the microcontroller device for optimum start-up and operation over temperature/voltage extremes.

An external oscillator source can be used by connecting a 3.3V clock signal to the OSCIN pin and leaving the OSCOUT pin unconnected (open) as shown in the figure below.
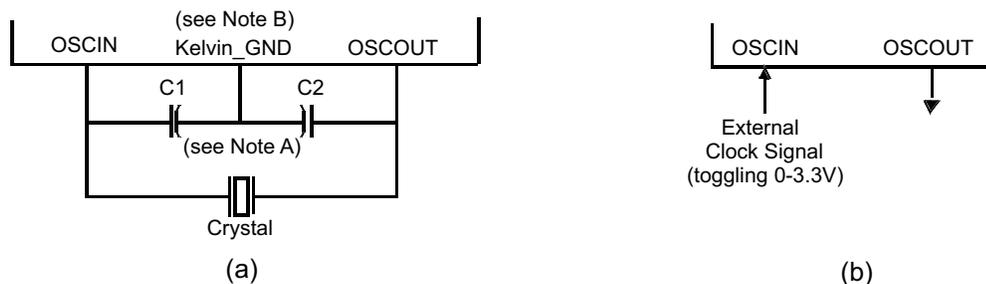

Note A: The values of C1 and C2 should be provided by the resonator/crystal vendor.
Note B: Kelvin_GND should not be connected to any other GND.

Figure 4-4. Recommended Crystal/Clock Connection

PRODUCT PREVIEW

4.6.1.1.1 Timing Requirements for Main Oscillator

Table 4-9. Timing Requirements for Main Oscillator

Parameter		MIN	Type	MAX	Unit
tc(OSC)	Cycle time, OSCIN (when using a sine-wave input)	50		200	ns
tc(OSC_SQR)	Cycle time, OSCIN, (when input to the OSCIN is a square wave)	12.5		200	ns
tw(OSCIL)	Pulse duration, OSCIN low (when input to the OSCIN is a square wave)	15			ns
tw(OSCIH)	Pulse duration, OSCIN high (when input to the OSCIN is a square wave)	15			ns

PRODUCT PREVIEW

4.6.1.2 Low Power Oscillator

The Low Power Oscillator (LPO) is comprised of two oscillators — HF LPO and LF LPO, in a single macro.

4.6.1.2.1 Features

The main features of the LPO are:

- Supplies a clock at extremely low power for power-saving modes. This is connected as clock source # 4 of the Global Clock Module.
- Supplies a high-frequency clock for non-timing-critical systems. This is connected as clock source # 5 of the Global Clock Module.
- Provides a comparison clock for the crystal oscillator failure detection circuit.
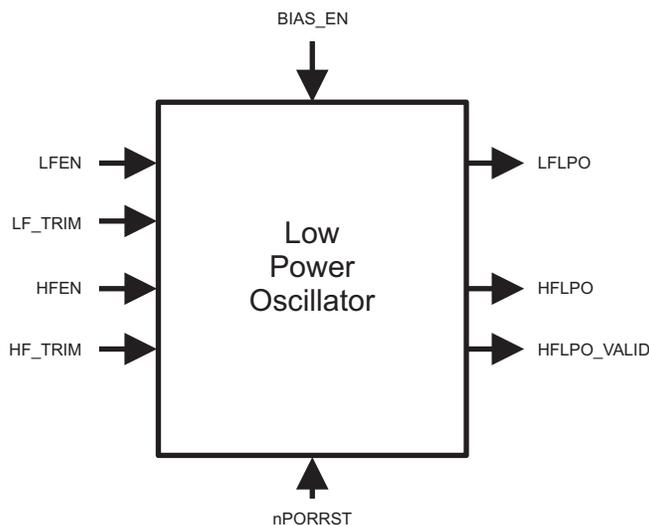

Figure 4-5. LPO Block Diagram

Figure 4-5 shows a block diagram of the internal reference oscillator. This is a low power oscillator (LPO) and provides two clock sources: one nominally 80KHz and one nominally 10MHz.

Table 4-10. LPO Specifications

Parameter		MIN	Typical	MAX	Unit
Clock Detection	oscillator fail frequency - lower threshold, using untrimmed LPO output	1.375	2.4	4.875	MHz
	oscillator fail frequency - higher threshold, using untrimmed LPO output	22	38.4	78	MHz
LPO - HF oscillator	untrimmed frequency	5.5	9.6	19.5	MHz
	startup time from STANDBY (LPO BIAS_EN High for at least 900µs)			10	µs
	cold startup time			900	µs
LPO - LF oscillator	untrimmed frequency	36	85	180	kHz
	startup time from STANDBY (LPO BIAS_EN High for at least 900µs)			100	µs
	cold startup time			2000	µs

PRODUCT PREVIEW

4.6.1.3 Phase Locked Loop (PLL) Clock Modules

The PLL is used to multiply the input frequency to some higher frequency.

The main features of the PLL are:

- Frequency modulation can be optionally superimposed on the synthesized frequency of PLL1. The frequency modulation capability of PLL2 is permanently disabled.
- Configurable frequency multipliers and dividers.
- Built-in PLL Slip monitoring circuit.
- Option to reset the device on a PLL slip detection.

4.6.1.3.1 Block Diagram

Figure 4-6 shows a high-level block diagram of the two PLL macros on this microcontroller. PLLCTL1 and PLLCTL2 are used to configure the multiplier and dividers for the PLL1. PLLCTL3 is used to configure the multiplier and dividers for PLL2.

$$f_{PLLCLK} = (f_{OSCIN} / NR) * NF / (OD * R)$$

$$f_{PLL2CLK} = (f_{OSCIN} / NR2) * NF2 / (OD2 * R2)$$
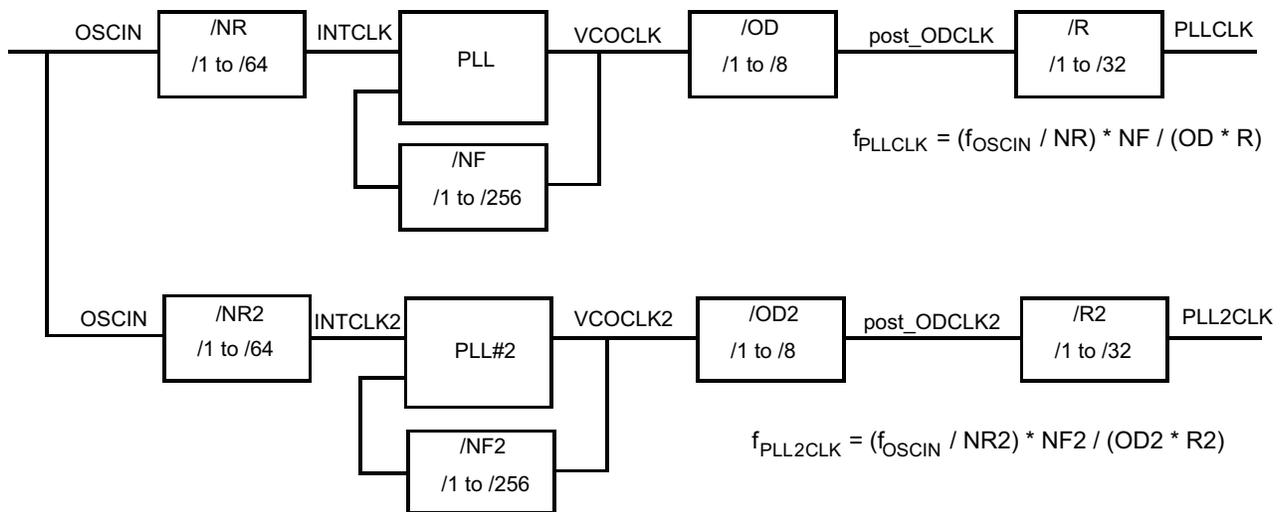

Figure 4-6. PLLx Block Diagram

4.6.1.3.2 PLL Timing Specifications

Table 4-11. PLL Timing Specifications

PARAMETER		MIN	MAX	UNIT
f_{INTCLK}	PLL1 Reference Clock frequency	1	$f_{(OSC\_SQR)}$	MHz
f_{post_ODCLK}	Post-ODCLK – PLL1 Post-divider input clock frequency		400	MHz
f_{VCOCLK}	VCOCLK – PLL1 Output Divider (OD) input clock frequency	150	550	MHz
$f_{INTCLK2}$	PLL2 Reference Clock frequency	1	$f_{(OSC\_SQR)}$	MHz
f_{post_ODCLK2}	Post-ODCLK – PLL2 Post-divider input clock frequency		400	MHz
$f_{VCOCLK2}$	VCOCLK – PLL2 Output Divider (OD) input clock frequency	150	550	MHz

PRODUCT PREVIEW

4.6.1.4 External Clock Inputs

The device supports up to two external clock inputs. This clock input must be a square wave input. The electrical and timing requirements for these clock inputs are specified below.

Table 4-12. External Clock Timing and Electrical Specifications

Parameter	Description	Min	Max	Unit
$f_{EXTCLKx}$	External clock input frequency		80	MHz
$t_{w(EXTCLKIN)H}$	EXTCLK high-pulse duration	6		ns
$t_{w(EXTCLKIN)L}$	EXTCLK low-pulse duration	6		ns
$v_{iL(EXTCLKIN)}$	Low-level input voltage	-0.3	0.8	V
$v_{iH(EXTCLKIN)}$	High-level input voltage	2	VCCIO + 0.3	V

4.6.2 Clock Domains

4.6.2.1 Clock Domain Descriptions

The table below lists the device clock domains and their default clock sources. The table also shows the system module control register that is used to select an available clock source for each clock domain.

Table 4-13. Clock Domain Descriptions

Clock Domain Name	Default Clock Source	Clock Source Selection Register	Description
HCLK	OSCIN	GHVSRC	• Is disabled via the CDDISx registers bit 1 • Used for all system modules including DMA, ESM
GCLK	OSCIN	GHVSRC	• Always the same frequency as HCLK • In phase with HCLK • Is disabled separately from HCLK via the CDDISx registers bit 0 • Can be divided by 1up to 8 when running CPU self-test (LBIST) using the CLKDIV field of the STCCLKDIV register at address 0xFFFFE108
GCLK2	OSCIN	GHVSRC	• Always the same frequency as GCLK • 2 cycles delayed from GCLK • Is disabled along with GCLK • Gets divided by the same divider setting as that for GCLK when running CPU self-test (LBIST)
VCLK	OSCIN	GHVSRC	• Divided down from HCLK • Can be HCLK/1, HCLK/2, ... or HCLK/16 • Is disabled separately from HCLK via the CDDISx registers bit 2
VCLK2	OSCIN	GHVSRC	• Divided down from HCLK • Can be HCLK/1, HCLK/2, ... or HCLK/16 • Frequency must be an integer multiple of VCLK frequency • Is disabled separately from HCLK via the CDDISx registers bit 3
VCLK3	OSCIN	GHVSRC	• Divided down from HCLK • Can be HCLK/1, HCLK/2, ... or HCLK/16 • Is disabled separately from HCLK via the CDDISx registers bit 8
VCLK4	OSCIN	GHVSRC	• Divided down from HCLK • Can be HCLK/1, HCLK/2, ... or HCLK/16 • Is disabled separately from HCLK via the CDDISx registers bit 9
VCLKA1	VCLK	VCLKASRC	• Defaults to VCLK as the source • Is disabled via the CDDISx registers bit 4
VCLKA2	VCLK	VCLKASRC	• Defaults to VCLK as the source • Is disabled via the CDDISx registers bit 5

PRODUCT PREVIEW

Table 4-13. Clock Domain Descriptions (continued)

Clock Domain Name	Default Clock Source	Clock Source Selection Register	Description
VCLKA3_S	VCLK	VCLKACON	• Defaults to VCLK as the source • Frequency can be as fast as HCLK frequency. • Is disabled via the CDDISx registers bit 10
VCLKA3_DIVR	VCLK	VCLKACON1	• Divided down from the AVCLK3_S using the VCLKA3R field of the VCLKACON1 register at address 0xFFFFE140 • Frequency can be VCLKA3_S/1, VCLKA3_S/2, ..., or VCLKA3_S/8 • Default frequency is VCLKA3_S/2 • Is disabled separately via the VCLKACON1 register VCLKA3_DIV_CDDIS bit only if the VCLKA3_S clock is not disabled
VCLKA4_S	VCLK	VCLKACON1	• Defaults to VCLK as the source • Frequency can be as fast as HCLK frequency • Is disabled via the CDDISx registers bit 11
VCLKA4_DIVR	VCLK	VCLKACON1	• Divided down from the VCLKA4_S using the VCLKA4R field of the VCLKACON1 register at address 0xFFFFE140 • Frequency can be VCLKA4_S/1, VCLKA4_S/2, ..., or VCLKA4_S/8 • Default frequency is VCLKA4_S/2 • Is disabled separately via the VCLKACON1 register VCLKA4_DIV_CDDIS bit only if the VCLKA4_S clock is not disabled
RTICLK	VCLK	RCLKSRC	• Defaults to VCLK as the source • If a clock source other than VCLK is selected for RTICLK, then the RTICLK frequency must be less than or equal to VCLK/3 – Application can ensure this by programming the RTI1DIV field of the RCLKSRC register, if necessary • Is disabled via the CDDISx registers bit 6

PRODUCT PREVIEW

4.6.2.2   Mapping of Clock Domains to Device Modules

Each clock domain has a dedicated functionality as shown in the figures below.
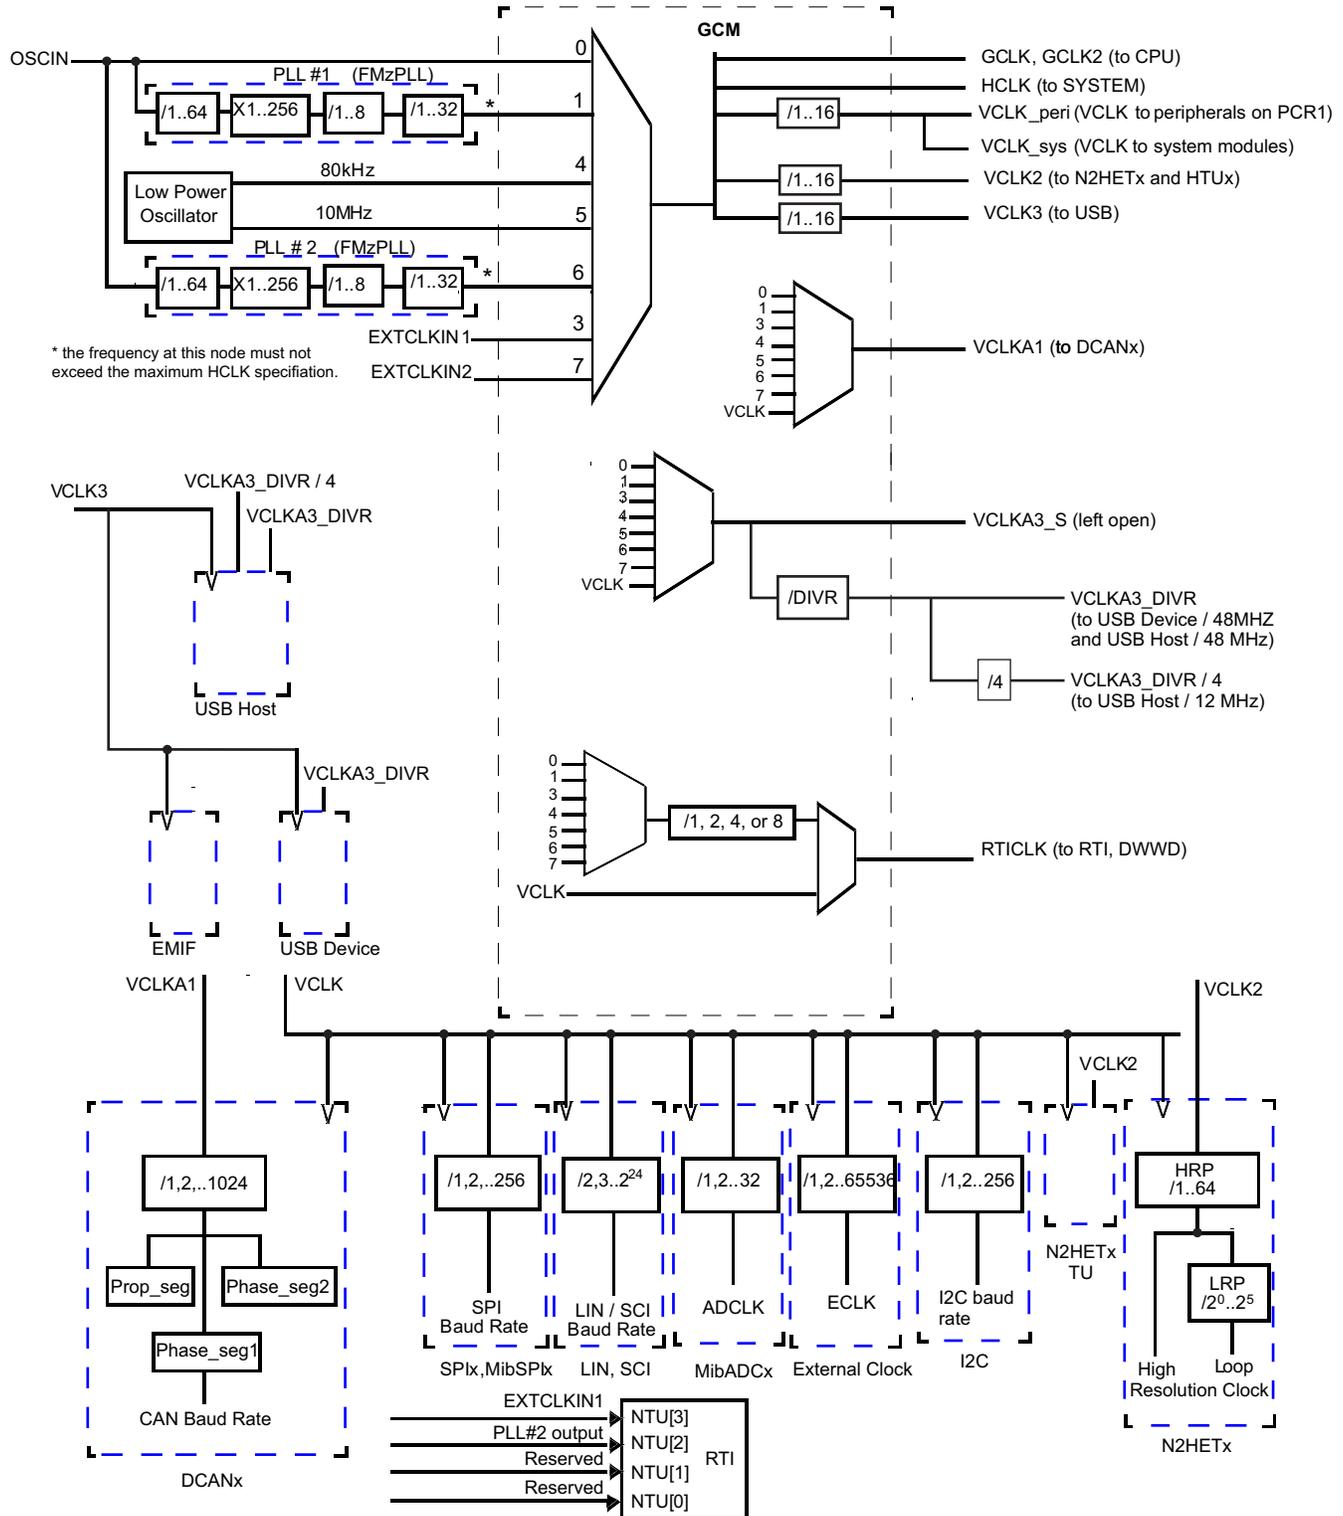

Figure 4-7. Device Clock Domains

4.6.3   Clock Test Mode

The TMS570 platform architecture defines a special mode that allows various clock signals to be brought out on to the ECLK pin and N2HET1[12] device outputs. This mode is called the Clock Test mode. It is very useful for debugging purposes and can be configured via the CLKTEST register in the system module.

Table 4-14. Clock Test Mode Options

SEL_ECP_PIN = CLKTEST[3-0]	SIGNAL ON ECLK	SEL_GIO_PIN = CLKTEST[11-8]	SIGNAL ON N2HET1[12]
0000	Oscillator	0000	Oscillator Valid Status
0001	Main PLL free-running clock output	0001	Main PLL Valid status
0010	Reserved	0010	Reserved
0011	EXTCLKIN1	0011	Reserved
0100	LFLPO	0100	Reserved
0101	HFLPO	0101	HFLPO Valid status
0110	Secondary PLL free-running clock output	0110	Secondary PLL Valid Status
0111	EXTCLKIN2	0111	Reserved
1000	GCLK	1000	LFLPO
1001	RTI Base	1001	Oscillator Valid status
1010	Reserved	1010	Oscillator Valid status
1011	VCLKA1	1011	Oscillator Valid status
1100	Reserved	1100	Oscillator Valid status
1101	VCLKA3_DIVR	1101	VCLKA3_S
1110	VCLKA4_DIVR	1110	VCLKA4_S
1111	Reserved	1111	Oscillator Valid status

PRODUCT PREVIEW

4.7 Clock Monitoring

The LPO Clock Detect (LPOCLKDET) module consists of a clock monitor (CLKDET) and an internal low power oscillator (LPO).

The LPO provides two different clock sources – a low frequency (LFLPO) and a high frequency (HFLPO).

The CLKDET is a supervisor circuit for an externally supplied clock signal (OSCIN). In case the OSCIN frequency falls out of a frequency window, the CLKDET flags this condition in the global status register (GLBSTAT bit 0: OSC FAIL) and switches all clock domains sourced by OSCIN to the HFLPO clock (limp mode clock).

The valid OSCIN frequency range is defined as: $f_{HFLPO} / 4 < f_{OSCIN} < f_{HFLPO} * 4$.

4.7.1 Clock Monitor Timings

For more information on LPO and Clock detection, refer to Table 4-10.
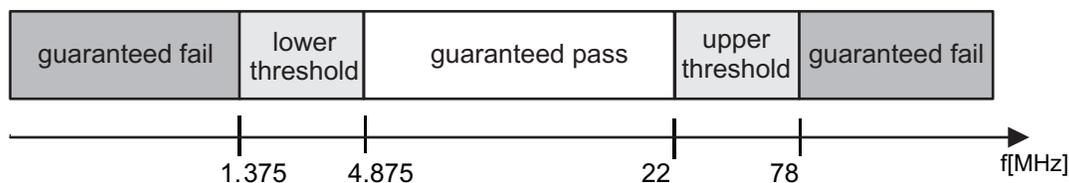

Figure 4-8. LPO and Clock Detection, Untrimmed HFLPO

4.7.2 External Clock (ECLK) Output Functionality

The ECLK pin can be configured to output a pre-scaled clock signal indicative of an internal device clock. This output can be externally monitored as a safety diagnostic.

4.7.3 Dual Clock Comparators

The Dual Clock Comparator (DCC) module determines the accuracy of selectable clock sources by counting the pulses of two independent clock sources (counter 0 and counter 1). If one clock is out of spec, an error signal is generated. For example, the DCC1 can be configured to use HFLPO as the reference clock (for counter 0) and VCLK as the "clock under test" (for counter 1). This configuration allows the DCC1 to monitor the PLL output clock when VCLK is using the PLL output as its source.

An additional use of this module is to measure the frequency of a selectable clock source, using the input clock as a reference, by counting the pulses of two independent clock sources. Counter 0 generates a fixed-width counting window after a preprogrammed number of pulses. Counter 1 generates a fixed-width pulse (1 cycle) after a pre-programmed number of pulses. This pulse sets as an error signal if counter 1 does not reach 0 within the counting window generated by counter 0.

4.7.3.1 Features

- Takes two different clock sources as input to two independent counter blocks.
- One of the clock sources is the known-good, or reference clock; the second clock source is the "clock under test."
- Each counter block is programmable with initial, or seed values.
- The counter blocks start counting down from their seed values at the same time; a mismatch from the expected frequency for the clock under test generates an error signal which is used to interrupt the CPU.

4.8 Glitch Filters

A glitch filter is present on the following signals.

Table 4-19. Glitch Filter Timing Specifications

Pin	Parameter		MIN	MAX	Unit
nPORRST	$t_{f(nPORRST)}$	Filter time nPORRST pin; pulses less than MIN will be filtered out, pulses greater than MAX will generate a reset[1]	500	2000	ns
nRST	$t_{f(nRST)}$	Filter time nRST pin; pulses less than MIN will be filtered out, pulses greater than MAX will generate a reset	500	2000	ns
TEST	$t_{f(TEST)}$	Filter time TEST pin; pulses less than MIN will be filtered out, pulses greater than MAX will pass through	500	2000	ns

(1) The glitch filter design on the nPORRST signal is designed such that no size pulse will reset any part of the microcontroller (flash pump, I/O pins, etc.) without also generating a valid reset signal to the CPU.

4.9 Device Memory Map

4.9.1 Memory Map Diagram

The figure below shows the device memory map.
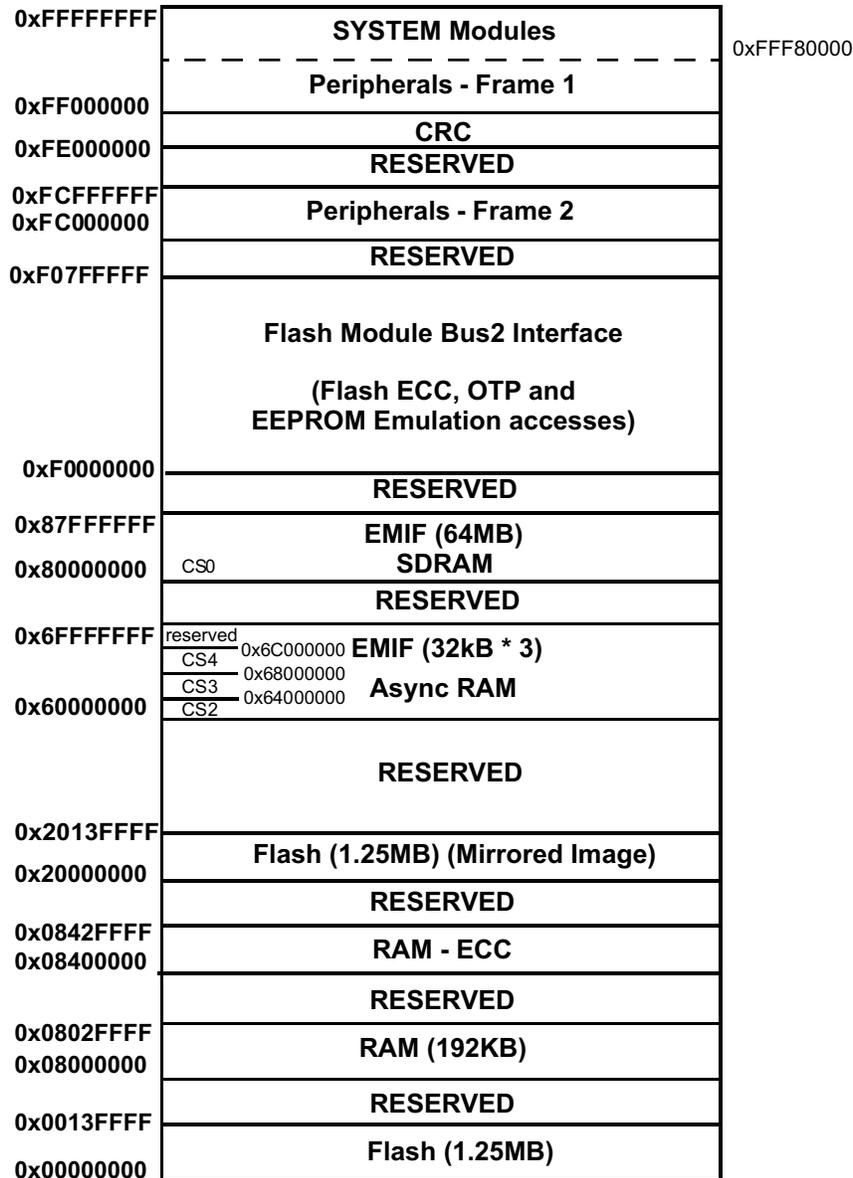

Figure 4-9. Memory Map

The Flash memory is mirrored to support ECC logic testing. The base address of the mirrored Flash image is 0x2000 0000.

4.9.2 Memory Map Table

Please refer to and for a block diagrams showing the devices interconnect.

Table 4-20. Device Memory Map

MODULE NAME	FRAME CHIP SELECT	FRAME ADDRESS RANGE		FRAME SIZE	ACTUAL SIZE	RESPNSE FOR ACCESS TO UNIMPLEMENTED LOCATIONS IN FRAME
		START	END			
Memories tightly coupled to the ARM Cortex-R4F CPU

4.9.3   Special Consideration for CPU Access Errors Resulting in Imprecise Aborts

Any CPU write access to a Normal or Device type memory, which generates a fault, will generate an imprecise abort. The imprecise abort exception is disabled by default and must be enabled for the CPU to handle this exception. The imprecise abort handling is enabled by clearing the "A" bit in the CPU's program status register (CPSR).

4.9.4   Master/Slave Access Privileges

The table below lists the access permissions for each bus master on the device. A bus master is a module that can initiate a read or a write transaction on the device.

Each slave module on the main interconnect is listed in the table. A "Yes" indicates that the module listed in the "MASTERS" column can access that slave module.

Table 4-21. Master / Slave Access Matrix

MASTERS	ACCESS MODE	SLAVES ON MAIN SCR				
		Flash Module Bus2 Interface: OTP, ECC, Bank 7	Non-CPU Accesses to Program Flash and CPU Data RAM	CRC	EMIF, Slave Interfaces	Peripheral Control Registers, All Peripheral Memories, And All System Module Control Registers And Memories
CPU READ	User/Privilege	Yes	Yes	Yes	Yes	Yes
CPU WRITE	User/Privilege	**No**	Yes	Yes	Yes	Yes
DMA	User	Yes	Yes	Yes	Yes	Yes
POM	User	Yes	Yes	Yes	Yes	Yes
DAP	Privilege	Yes	Yes	Yes	Yes	Yes
HTU1	Privilege	**No**	Yes	Yes	Yes	Yes
HTU2	Privilege	**No**	Yes	Yes	Yes	Yes
OHCI	User	**No**	Yes	**No**	Yes	**No**

4.9.5 Special Notes on Accesses to Certain Slaves

Write accesses to the Power Domain Management Module (PMM) control registers are limited to the CPU (master id = 1). The other masters can only read from these registers.

A debugger can also write to the PMM registers. The master-id check is disabled in debug mode.

The device contains dedicated logic to generate a bus error response on any access to a module that is in a power domain that has been turned OFF.

4.9.6 Parameter Overlay Module (POM) Considerations

- The POM can map onto up to 8MB of the internal or external memory space. The starting address and the size of the memory overlay are configurable via the POM control registers. Care must be taken to ensure that the overlay is mapped on to available memory.
- ECC must be disabled by software via CP15 in case POM overlay is enabled; otherwise ECC errors will be generated.
- POM overlay must not be enabled when the flash and internal RAM memories are swapped via the MEM SWAP field of the Bus Matrix Module Control Register 1 (BMMCR1).

PRODUCT PREVIEW

- When POM is used to overlay the flash on to internal or external RAM, there is a bus contention possibility when another master accesses the TCM flash. This results in a system hang.
    - The POM implements a timeout feature to detect this exact scenario. The timeout needs to be enabled whenever POM overlay is enabled.
    - The timeout can be enabled by writing 1010 to the Enable TimeOut (ETO) field of the POM Global Control register (POMGLBCTRL, address = 0xFFA04000).
    - In case a read request by the POM cannot be completed within 32 HCLK cycles, the timeout (TO) flag is set in the POM Flag register (POMFLG, address = 0xFFA0400C). Also, an abort is generated to the CPU. This can be a prefetch abort for an instruction fetch or a data abort for a data fetch.
    - The prefetch- and data-abort handlers must be modified to check if the TO flag in the POM is set. If so, then the application can assume that the timeout is caused by a bus contention between the POM transaction and another master accessing the same memory region. The abort handlers need to clear the TO flag, so that any further aborts are not misinterpreted as having been caused due to a timeout from the POM.

4.10 Flash Memory

4.10.1 Flash Memory Configuration

Flash Bank: A separate block of logic consisting of 1 to 16 sectors. Each flash bank normally has a customer-OTP and a TI-OTP area. These flash sectors share input/output buffers, data paths, sense amplifiers, and control logic.

Flash Sector: A contiguous region of flash memory which must be erased simultaneously due to physical construction constraints.

Flash Pump: A charge pump which generates all the voltages required for reading, programming, or erasing the flash banks.

Flash Module: Interface circuitry required between the host CPU and the flash banks and pump module.

Table 4-22. Flash Memory Banks and Sectors

Memory Arrays (or Banks)	Sector No.	Segment	Low Address	High Address
BANK0 (1.25MBytes)	0	16K Bytes	0x0000_0000	0x0000_3FFF
	1	16K Bytes	0x0000_4000	0x0000_7FFF
	2	16K Bytes	0x0000_8000	0x0000_BFFF
	3	16K Bytes	0x0000_C000	0x0000_FFFF

	15	128K Bytes	0x0012_0000	0x0013_FFFF
BANK7 (64kBytes) for EEPROM emulation	0	16K Bytes	0xF020_0000	0xF020_3FFF
	1	16K Bytes	0xF020_4000	0xF020_7FFF
	2	16K Bytes	0xF020_8000	0xF020_BFFF
	3	16K Bytes	0xF020_C000	0xF020_FFFF

4.10.2 Main Features of Flash Module

- Support for multiple flash banks for program and/or data storage
- Simultaneous read access on a bank while performing program or erase operation on any other bank
- Integrated state machines to automate flash erase and program operations
- Pipelined mode operation to improve instruction access interface bandwidth
- Support for Single Error Correction Double Error Detection (SECDED) block inside Cortex-R4F CPU
  – Error address is captured for host system debugging
- Support for a rich set of diagnostic features

PRODUCT PREVIEW

4.10.3 ECC Protection for Flash Accesses

All accesses to the program flash memory are protected by Single Error Correction Double Error Detection (SECDED) logic embedded inside the CPU. The flash module provides 8 bits of ECC code for 64 bits of instructions or data fetched from the flash memory. The CPU calculates the expected ECC code based on the 64 bits received and compares it with the ECC code returned by the flash module. A single-bit error is corrected and flagged by the CPU, while a multi-bit error is only flagged. The CPU signals an ECC error via its Event bus. This signaling mechanism is not enabled by default and must be enabled by setting the "X" bit of the Performance Monitor Control Register, c9.

```
MRC p15,#0,r1,c9,c12,#0     ;Enabling Event monitor states
ORR r1, r1, #0x00000010
MCR p15,#0,r1,c9,c12,#0     ;Set 4th bit ('X') of PMNC register
MRC p15,#0,r1,c9,c12,#0
```

The application must also explicitly enable the CPU's ECC checking for accesses on the CPU's ATCM and BTCM interfaces. These are connected to the program flash and data RAM respectively. ECC checking for these interfaces can be done by setting the B1TCMPCEN, B0TCMPCEN and ATCMPCEN bits of the System Control coprocessor's Auxiliary Control Register, c1.

```
MRC p15, #0, r1, c1, c0, #1
ORR r1, r1, #0x0e000000      ;Enable ECC checking for ATCM and BTCMs
DMB
MCR p15, #0, r1, c1, c0, #1
```

4.10.4 Flash Access Speeds

For information on flash memory access speeds and the relevant wait states required, refer to Section 3.4.

PRODUCT PREVIEW

4.10.5 Program Flash

Table 4-23. Timing Requirements for Program Flash

Parameter		MIN	NOM	MAX	Unit
$t_{prog(144bit)}$ Wide Word (144bit) programming time			40	300	µs
$t_{prog(Total)}$ 1.25MByte programming time[1]	-40°C to 105°C			13	s
	0°C to 60°C, for first 25 cycles		3.3	6.6	s
$t_{erase(bank0)}$ Sector/Bank erase time	-40°C to 105°C		0.3	4	s
	0°C to 60°C, for first 25 cycles		30	500	ms
t_{wec} Write/erase cycles with 15 year Data Retention requirement	-40°C to 105°C			1000	cycles

(1) This programming time includes overhead of state machine, but does not include data transfer time. The programming time assumes programming 144 bits at a time at the maximum specified operating frequency.

4.10.6 Data Flash

Table 4-24. Timing Requirements for Data Flash

Parameter		MIN	NOM	MAX	Unit
$t_{prog(144bit)}$ Wide Word (144bit) programming time			40	300	µs
$t_{prog(Total)}$ EEPROM Emulation (bank 7) 64kByte programming time[1]	-40°C to 105°C			660	ms
	0°C to 60°C, for first 25 cycles		165	330	ms
EEPROM Emulation (bank 7) Sector/Bank erase time $t_{erase(bank7)}$	-40°C to 105°C		0.08	8	s
	0°C to 60°C, for first 25 cycles		30	500	ms
t_{wec} Write/erase cycles with 15 year Data Retention requirement	-40°C to 105°C			100000	cycles

(1) This programming time includes overhead of state machine, but does not include data transfer time. The programming time assumes programming 144 bits at a time at the maximum specified operating frequency.

PRODUCT PREVIEW

4.11 Tightly-Coupled RAM Interface Module

Figure 4-10 illustrates the connection of the Tightly Coupled RAM (TCRAM) to the Cortex-R4F™ CPU.
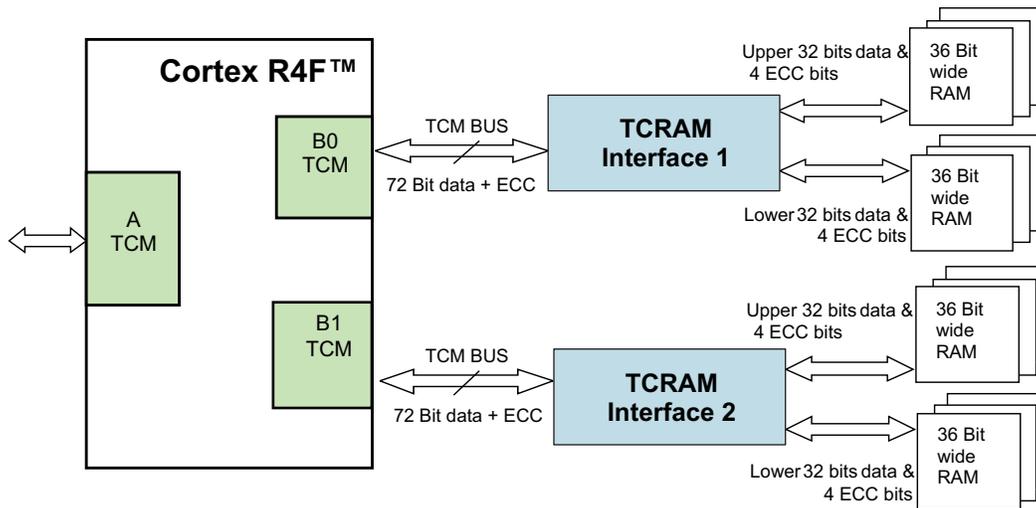

Figure 4-10. TCRAM Block Diagram

4.11.1 Features

The features of the Tightly Coupled RAM (TCRAM) Module are:

*   Acts as slave to the Cortex-R4F CPU's BTCM interface
*   Supports CPU's internal ECC scheme by providing 64-bit data and 8-bit ECC code
*   Monitors CPU Event Bus and generates single or multi-bit error interrupts
*   Stores addresses for single and multi-bit errors
*   Supports RAM trace module
*   Provides CPU address bus integrity checking by supporting parity checking on the address bus
*   Performs redundant address decoding for the RAM bank chip select and ECC select generation logic
*   Provides enhanced safety for the RAM addressing by implementing two 36-bit wide byte-interleaved RAM banks and generating independent RAM access control signals to the two banks
*   Supports auto-initialization of the RAM banks along with the ECC bits
*   No support for bit-wise RAM accesses

4.11.2 TCRAMW ECC Support

The TCRAMW passes on the ECC code for each data read by the Cortex-R4F CPU from the RAM. It also stores the CPU's ECC port contents in the ECC RAM when the CPU does a write to the RAM. The TCRAMW monitors the CPU's event bus and provides registers for indicating single/multi-bit errors and also for identifying the address that caused the single or multi-bit error. The event signaling and the ECC checking for the RAM accesses must be enabled inside the CPU.

For more information see the device Technical Reference Manual.

4.12 Parity Protection for Accesses to peripheral RAMs

Accesses to some peripheral RAMs are protected by odd/even parity checking. During a read access the parity is calculated based on the data read from the peripheral RAM and compared with the good parity value stored in the parity RAM for that peripheral. If any word fails the parity check, the module generates a parity error signal that is mapped to the Error Signaling Module. The module also captures the peripheral RAM address that caused the parity error.

The parity protection for peripheral RAMs is not enabled by default and must be enabled by the application. Each individual peripheral contains control registers to enable the parity protection for accesses to its RAM.

NOTE

The CPU read access gets the actual data from the peripheral. The application can choose to generate an interrupt whenever a peripheral RAM parity error is detected.

4.13 On-Chip SRAM Initialization and Testing

4.13.1 On-Chip SRAM Self-Test Using PBIST

4.13.1.1 Features

- Extensive instruction set to support various memory test algorithms
- ROM-based algorithms allow application to run TI production-level memory tests
- Independent testing of all on-chip SRAM

4.13.1.2 PBIST RAM Groups

Table 4-25. PBIST RAM Grouping

Memory	RAM Group	Test Clock	MEM Type	Test Pattern (Algorithm)			
				triple read slow read	triple read fast read	March 13N[1] two port (cycles)	March 13N[1] single port (cycles)
				ALGO MASK 0x1	ALGO MASK 0x2	ALGO MASK 0x4	ALGO MASK 0x8
PBIST_ROM	1	ROM CLK	ROM	X	X		
STC_ROM	2	ROM CLK	ROM	X	X		
DCAN1	3	VCLK	Dual Port			25200	
DCAN2	4	VCLK	Dual Port			25200	
DCAN3	5	VCLK	Dual Port			25200	
ESRAM1	6	HCLK	Single Port				266280
MIBSPI1	7	VCLK	Dual Port			33440	
MIBSPI3	8	VCLK	Dual Port			33440	
MIBSPI5	9	VCLK	Dual Port			33440	
VIM	10	VCLK	Dual Port			12560	
MIBADC1	11	VCLK	Dual Port			4200	
DMA	12	HCLK	Dual Port			18960	
N2HET1	13	VCLK	Dual Port			31680	
HET TU1	14	VCLK	Dual Port			6480	
MIBADC2	18	VCLK	Dual Port			4200	
N2HET2	19	VCLK	Dual Port			31680	
HET TU2	20	VCLK	Dual Port			6480	
ESRAM5	21	HCLK	Single Port				266280
ESRAM6	22	HCLK	Single Port				266280
USB	26	VCLK3	Dual Port			4240	
	27		Single Port				66600

(1) There are several memory testing algorithms stored in the PBIST ROM. However, TI recommends the March13N algorithm for application testing.

The PBIST ROM clock frequency is limited to 100MHz, if 100MHz < HCLK <= HCLKmax, or HCLK, if HCLK <= 100MHz.

The PBIST ROM clock is divided down from HCLK. The divider is selected by programming the ROM_DIV field of the Memory Self-Test Global Control Register (MSTGCR) at address 0xFFFFFF58.

PRODUCT PREVIEW

4.13.2 On-Chip SRAM Auto Initialization

This microcontroller allows some of the on-chip memories to be initialized via the Memory Hardware Initialization mechanism in the System module. This hardware mechanism allows an application to program the memory arrays with error detection capability to a known state based on their error detection scheme (odd/even parity or ECC).

The MINITGCR register enables the memory initialization sequence, and the MSINENA register selects the memories that are to be initialized.

For more information on these registers see the device Technical Reference Manual.

The mapping of the different on-chip memories to the specific bits of the MSINENA registers is shown in Table 4-26.

Table 4-26. Memory Initialization

CONNECTING MODULE	ADDRESS RANGE		MSINENA REGISTER BIT #
	BASE ADDRESS	ENDING ADDRESS	
RAM (PD#1)	0x08000000	0x0800FFFF	0[1]
RAM (RAM_PD#1)	0x08010000	0x0801FFFF	0[1]
RAM (RAM_PD#2)	0x08020000	0x0802FFFF	0[1]
MIBSPI5 RAM	0xFF0A0000	0xFF0BFFFF	12[2]
MIBSPI3 RAM	0xFF0C0000	0xFF0DFFFF	11[2]
MIBSPI1 RAM	0xFF0E0000	0xFF0FFFFF	7[2]
DCAN3 RAM	0xFF1A0000	0xFF1BFFFF	10
DCAN2 RAM	0xFF1C0000	0xFF1DFFFF	6
DCAN1 RAM	0xFF1E0000	0xFF1FFFFF	5
MIBADC2 RAM	0xFF3A0000	0xFF3BFFFF	14
MIBADC1 RAM	0xFF3E0000	0xFF3FFFFF	8
N2HET2 RAM	0xFF440000	0xFF57FFFF	15
N2HET1 RAM	0xFF460000	0xFF47FFFF	3
HET TU2 RAM	0xFF4C0000	0xFF4DFFFF	16
HET TU1 RAM	0xFF4E0000	0xFF4FFFFF	4
DMA RAM	0xFFF80000	0xFFF80FFF	1
VIM RAM	0xFFF82000	0xFFF82FFF	2
USB Device RAM	RAM is not CPU-Addressable		n/a

(1) The TCM RAM wrapper has separate control bits to select the RAM power domain that is to be auto-initialized.
(2) The MibSPIx modules perform an initialization of the transmit and receive RAMs as soon as the module is released from its local reset..
This is independent of whether the application chooses to initialize the MibSPIx RAMs using the system module auto-initialization method. The MibSPIx module must be first brought out of its local reset in order to use the system module auto-initialization method.

PRODUCT PREVIEW

4.14 External Memory Interface (EMIF)

4.14.1 Features

The EMIF includes many features to enhance the ease and flexibility of connecting to external asynchronous memories or SDRAM devices. The EMIF features includes support for:

- 3 addressable chip select for asynchronous memories of up to 32kB each
- 1 addressable chip select space for SDRAMs up to 128MB
- 8 or 16-bit data bus width
- Programmable cycle timings such as setup, strobe, and hold times as well as turnaround time
- Select strobe mode
- Extended Wait mode
- Data bus parking

4.14.2 Electrical and Timing Specifications

4.14.2.4 Write Timing (Synchronous RAM)
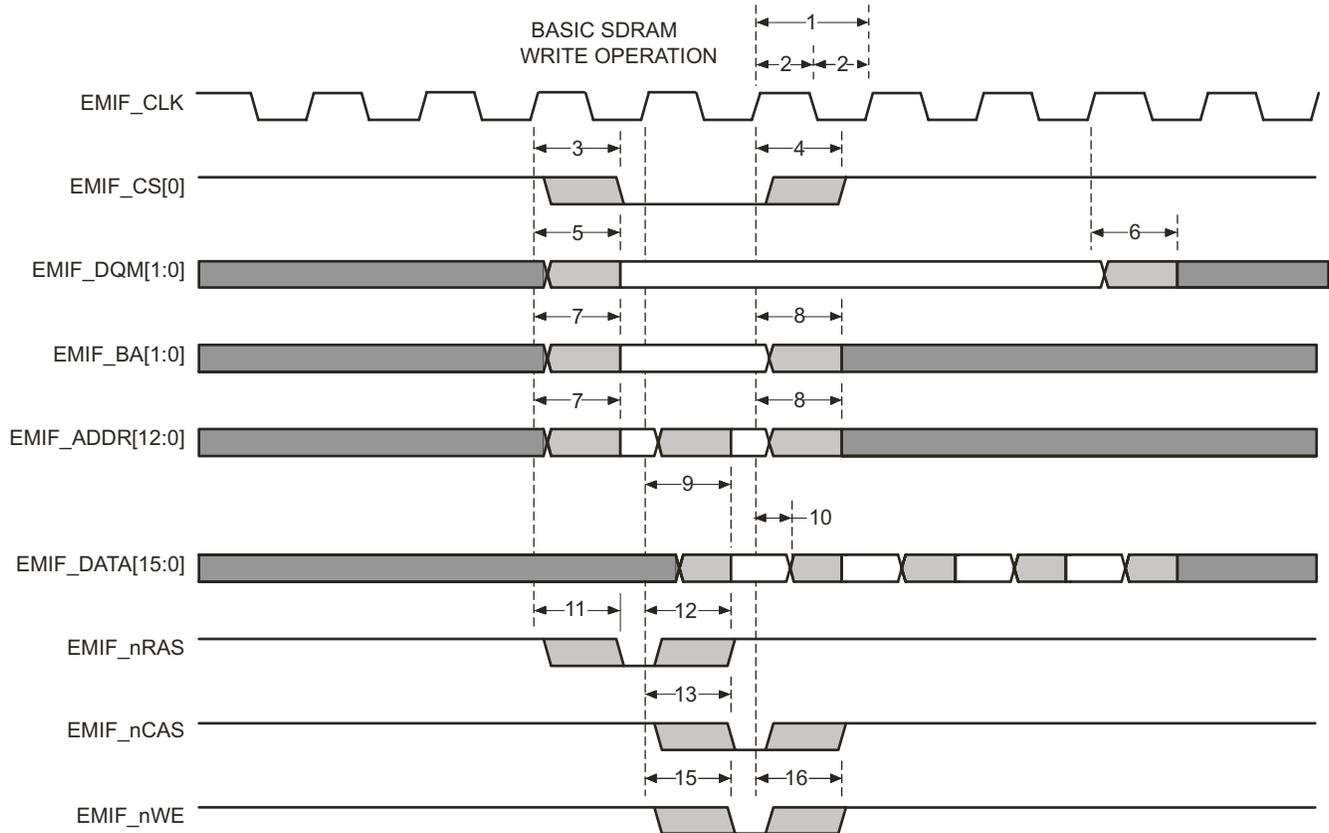

Figure 4-16. Basic SDRAM Write Operation

4.14.2.5 EMIF Asynchronous Memory Timing

Table 4-27. EMIF Asynchronous Memory Timing Requirements

NO.			Value			Unit
			MIN	NOM	MAX	
		Reads and Writes				
2	$t_{w(EM\_WAIT)}$	Pulse duration, EMIFnWAIT assertion and deassertion	2E			ns
		Reads				
12	$t_{su(EMDV-EMOEH)}$	Setup time, EMIFDATA[15:0] valid before EMIFnOE high	11			ns
13	$t_{h(EMOEH-EMDIV)}$	Hold time, EMIFDATA[15:0] valid after EMIFnOE high	0.5			ns
14	$t_{su(EMOEL-EMWAIT)}$	Setup Time, EMIFnWAIT asserted before end of Strobe Phase[1]	4E+3			ns
		Writes				
28	$t_{su(EMWEL-EMWAIT)}$	Setup Time, EMIFnWAIT asserted before end of Strobe Phase[1]	4E+3			ns

(1)   Setup before end of STROBE phase (if no extended wait states are inserted) by which EMIFnWAIT must be asserted to add extended wait states. Figure Figure 4-12 and Figure Figure 4-14 describe EMIF transactions that include extended wait states inserted during the STROBE phase. However, cycles inserted as part of this extended wait period should not be counted; the 4E requirement is to the start of where the HOLD phase would begin if there were no extended wait cycles.

4.15 Vectored Interrupt Manager

The vectored interrupt manager (VIM) provides hardware assistance for prioritizing and controlling the many interrupt sources present on this device. Interrupts are caused by events outside of the normal flow of program execution. Normally, these events require a timely response from the central processing unit (CPU); therefore, when an interrupt occurs, the CPU switches execution from the normal program flow to an interrupt service routine (ISR).

4.15.1 VIM Features

The VIM module has the following features:
- Supports 128 interrupt channels.
  - Provides programmable priority and enable for interrupt request lines.
- Provides a direct hardware dispatch mechanism for fastest IRQ dispatch.
- Provides two software dispatch mechanisms when the CPU VIC port is not used.
  - Index interrupt
  - Register vectored interrupt
- Parity protected vector interrupt table against soft errors.

4.15.2 Interrupt Request Assignments

PRODUCT PREVIEW

NOTE

Address location 0x00000000 in the VIM RAM is reserved for the phantom interrupt ISR entry; therefore only request channels 0..126 can be used and are offset by 1 address in the VIM RAM.

NOTE

The EMIF_nWAIT signal has a pull-up on it. The EMIF module generates a "Wait Rise" interrupt whenever it detects a rising edge on the EMIF_nWAIT signal. This interrupt condition is indicated as soon as the device is powered up. This can be ignored if the EMIF_nWAIT signal is not used in the application. If the EMIF_nWAIT signal is actually used in the application, then the external slave memory must always drive the EMIF_nWAIT signal such that an interrupt is not caused due to the default pull-up on this signal.

NOTE

The lower-order interrupt channels are higher priority channels than the higher-order interrupt channels.

NOTE

The application can change the mapping of interrupt sources to the interrupt channels via the interrupt channel control registers (CHANCTRLx) inside the VIM module.

4.16 DMA Controller

The DMA controller is used to transfer data between two locations in the memory map in the background of CPU operations. Typically, the DMA is used to:

- Transfer blocks of data between external and internal data memories
- Restructure portions of internal data memory
- Continually service a peripheral

4.16.1 DMA Features

- CPU independent data transfer
- One 64-bit master port that interfaces to the TMS570 Memory System.
- FIFO buffer(4 entries deep and each 64bit wide)
- Channel control information is stored in RAM protected by parity
- 16 channels with individual enable
- Channel chaining capability
- 32 peripheral DMA requests
- Hardware and Software DMA requests
- 8, 16, 32 or 64-bit transactions supported
- Multiple addressing modes for source/destination (fixed, increment, offset)
- Auto-initiation
- Power-management mode
- Memory Protection with four configurable memory regions

PRODUCT PREVIEW

4.16.2 Default DMA Request Map

The DMA module on this microcontroller has 16 channels and up to 32 hardware DMA requests. The module contains DREQASIx registers which are used to map the DMA requests to the DMA channels. By default, channel 0 is mapped to request 0, channel 1 to request 1, and so on.

Some DMA requests have multiple sources, as shown in Table 4-32. The application must ensure that only one of these DMA request sources is enabled at any time.

Table 4-32. DMA Request Line Connection

Modules	DMA Request Sources	DMA Request
MIBSPI1	MIBSPI1[1][1]	DMAREQ[0]
MIBSPI1	MIBSPI1[0][2]	DMAREQ[1]

4.17 Real Time Interrupt Module

The real-time interrupt (RTI) module provides timer functionality for operating systems and for benchmarking code. The RTI module can incorporate several counters that define the timebases needed for scheduling an operating system.

The timers also allow you to benchmark certain areas of code by reading the values of the counters at the beginning and the end of the desired code range and calculating the difference between the values.

4.17.1 Features

The RTI module has the following features:
- Two independent 64 bit counter blocks
- Four configurable compares for generating operating system ticks or DMA requests. Each event can be driven by either counter block 0 or counter block 1.
- Fast enabling/disabling of events
- Two time-stamp (capture) functions for system or peripheral interrupts, one for each counter block

4.17.2 Block Diagrams

Figure 4-17 shows a high-level block diagram for one of the two 64-bit counter blocks inside the RTI module. Both the counter blocks are identical except the Network Time Unit (NTUx) inputs are only available as time base inputs for the counter block 0.
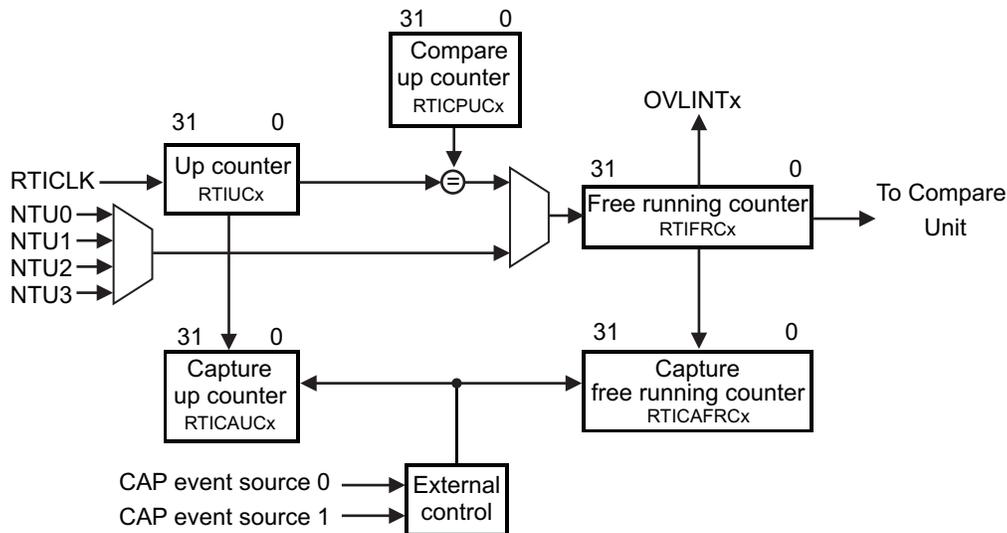

Figure 4-17. Counter Block Diagram
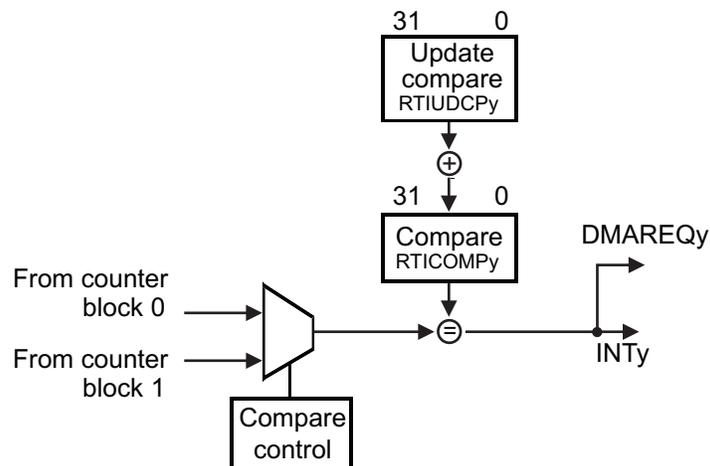

Figure 4-18. Compare Block Diagram

4.17.3 Clock Source Options

The RTI module uses the RTI1CLK clock domain for generating the RTI time bases.

The application can select the clock source for the RTI1CLK by configuring the RCLKSRC register in the System module at address 0xFFFFFF50. The default source for RTI1CLK is VCLK.

For more information on clock sources refer to Table 4-8 and Table 4-13.

4.17.4 Network Time Synchronization Inputs

The RTI module supports 4 Network Time Unit (NTU) inputs that signal internal system events, and which can be used to synchronize the time base used by the RTI module. On this device, these NTU inputs are connected as shown below.

Table 4-33. Network Time Synchronization Inputs

NTU Input	Source
0	Reserved
1	Reserved
2	PLL2 Clock output
3	EXTCLKIN1 clock input

4.18 Error Signaling Module

The Error Signaling Module (ESM) manages the various error conditions on the TMS570 microcontroller. The error condition is handled based on a fixed severity level assigned to it. Any severe error condition can be configured to drive a low level on a dedicated device terminal called nERROR. This can be used as an indicator to an external monitor circuit to put the system into a safe state.

4.18.1 Features

The features of the Error Signaling Module are:
- 128 interrupt/error channels are supported, divided into 3 different groups
  - 64 channels with maskable interrupt and configurable error pin behavior
  - 32 error channels with non-maskable interrupt and predefined error pin behavior
  - 32 channels with predefined error pin behavior only
- Error pin to signal severe device failure
- Configurable timebase for error signal
- Error forcing capability

4.18.2 ESM Channel Assignments

The Error Signaling Module (ESM) integrates all the device error conditions and groups them in the order of severity. Group1 is used for errors of the lowest severity while Group3 is used for errors of the highest severity. The device response to each error is determined by the severity group it is connected to. Table 4-35 shows the channel assignment for each group.

Table 4-34. ESM Groups

ERROR GROUP	INTERRUPT CHARACTERISTICS	INFLUENCE ON ERROR PIN
Group1	maskable, low or high priority	configurable
Group2	non-maskable, high priority	fixed
Group3	no interrupt generated	fixed

4.20 Digital Windowed Watchdog

This device includes a digital windowed watchdog (DWWD) module that protects against runaway code execution.

The DWWD module allows the application to configure the time window within which the DWWD module expects the application to service the watchdog. A watchdog violation occurs if the application services the watchdog outside of this window, or fails to service the watchdog at all. The application can choose to generate a system reset or an ESM group2 error signal in case of a watchdog violation.

The watchdog is disabled by default and must be enabled by the application. Once enabled, the watchdog can only be disabled upon a system reset.

4.21.5   JTAG Scan Interface Timings

Table 4-39. JTAG Scan Interface Timing[1]

No.	Parameter		Min	MAX	Unit
	fTCK	TCK frequency (at HCLKmax)		12	MHz
	fRTCK	RTCK frequency (at TCKmax and HCLKmax)	10		MHz
1	td(TCK -RTCK)	Delay time, TCK to RTCK		24	ns
2	tsu(TDI/TMS - RTCKr)	Setup time, TDI, TMS before RTCK rise (RTCKr)	21		ns
3	th(RTCKr -TDI/TMS)	Hold time, TDI, TMS after RTCKr	0		ns
4	th(RTCKr -TDO)	Hold time, TDO after RTCKf	0		ns
5	td(TCKf -TDO)	Delay time, TDO valid after RTCK fall (RTCKf)		10	ns

(1)   Timings for TDO are specified for a maximum of 50pF load on TDO
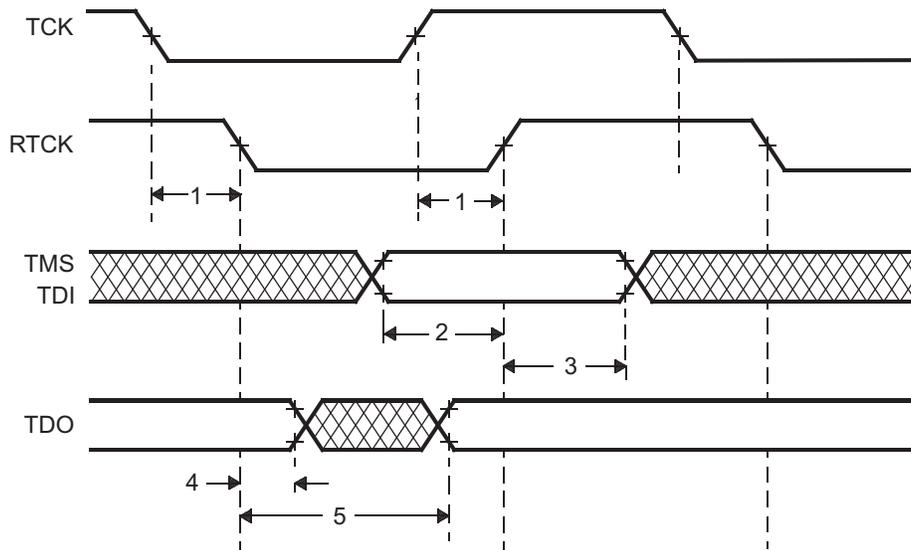

Figure 4-20. JTAG Timing

4.21.6 Advanced JTAG Security Module

This device includes a an Advanced JTAG Security Module (AJSM). which provides maximum security to the device's memory content by allowing users to secure the device after programming.
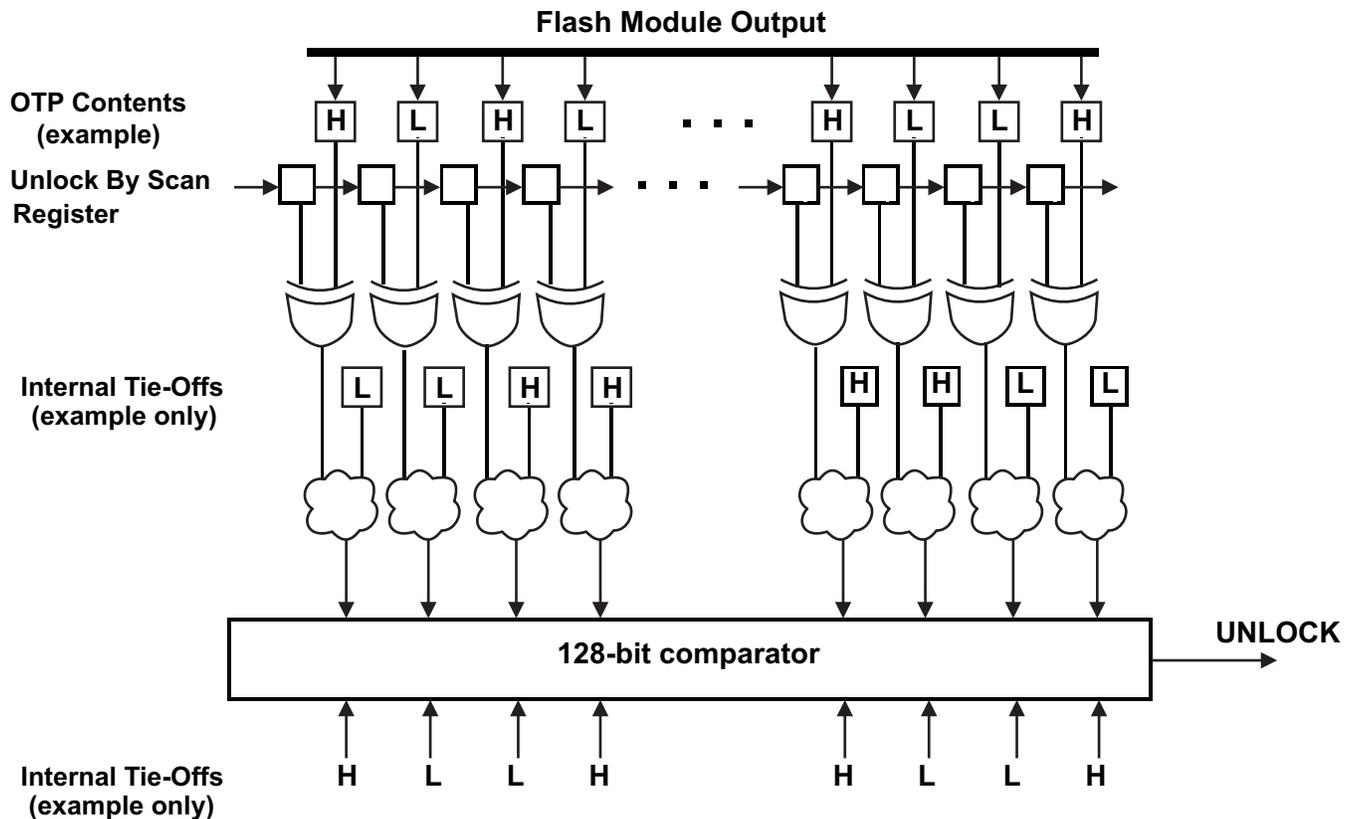

Figure 4-21. AJSM Unlock

The device is unsecure by default by virtue of a 128-bit visible unlock code programmed in the OTP address 0xF0000000.The OTP contents are XOR-ed with the "Unlock By Scan" register contents. The outputs of these XOR gates are again combined with a set of secret internal tie-offs. The output of this combinational logic is compared against a secret hard-wired 128-bit value. A match results in the UNLOCK signal being asserted, so that the device is now unsecure.

A user can secure the device by changing at least one bit in the visible unlock code from 1 to 0. Changing a 0 to 1 is not possible since the visible unlock code is stored in the One Time Programmable (OTP) flash region. Also, changing all the 128 bits to zeros is not a valid condition and will permanently secure the device.

Once secured, a user can unsecure the device by scanning an appropriate value into the "Unlock By Scan" register of the AJSM module. This register is accessible by configuring an IR value of 0b1011 on the AJSM TAP. The value to be scanned is such that the XOR of the OTP contents and the Unlock-By-Scan register contents results in the original visible unlock code.

The Unlock-By-Scan register is reset only upon asserting power-on reset (nPORRST).

A secure device only permits JTAG accesses to the AJSM scan chain via the Secondary Tap # 2 of the ICEPick module. All other secondary taps, test taps and the boundary scan interface are not accessible in this state.

4.21.7 Boundary Scan Chain

The device supports BSDL-compliant boundary scan for testing pin-to-pin compatibility. The boundary scan chain is connected to the Boundary Scan Interface of the ICEPICK module.
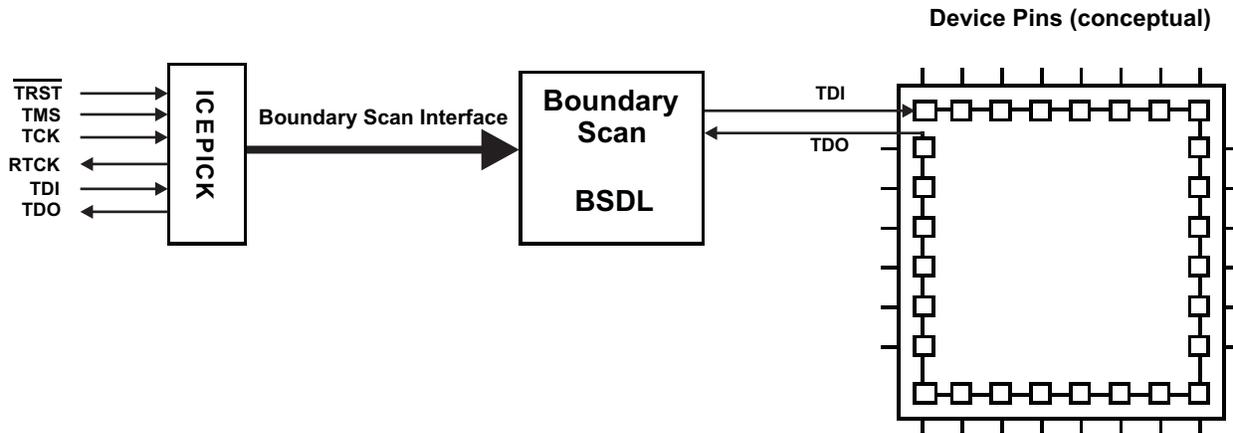

Figure 4-22. Boundary Scan Implementation (Conceptual Diagram)

Data is serially shifted into all boundary-scan buffers via TDI, and out via TDO.

5 Peripheral Information and Electrical Specifications

5.1 Enhanced Translator PWM Modules (ePWM)

Figure 5-1 illustrates the connections between the seven ePWM modules (ePWM1,2,3,4,5,6,7) on the device.
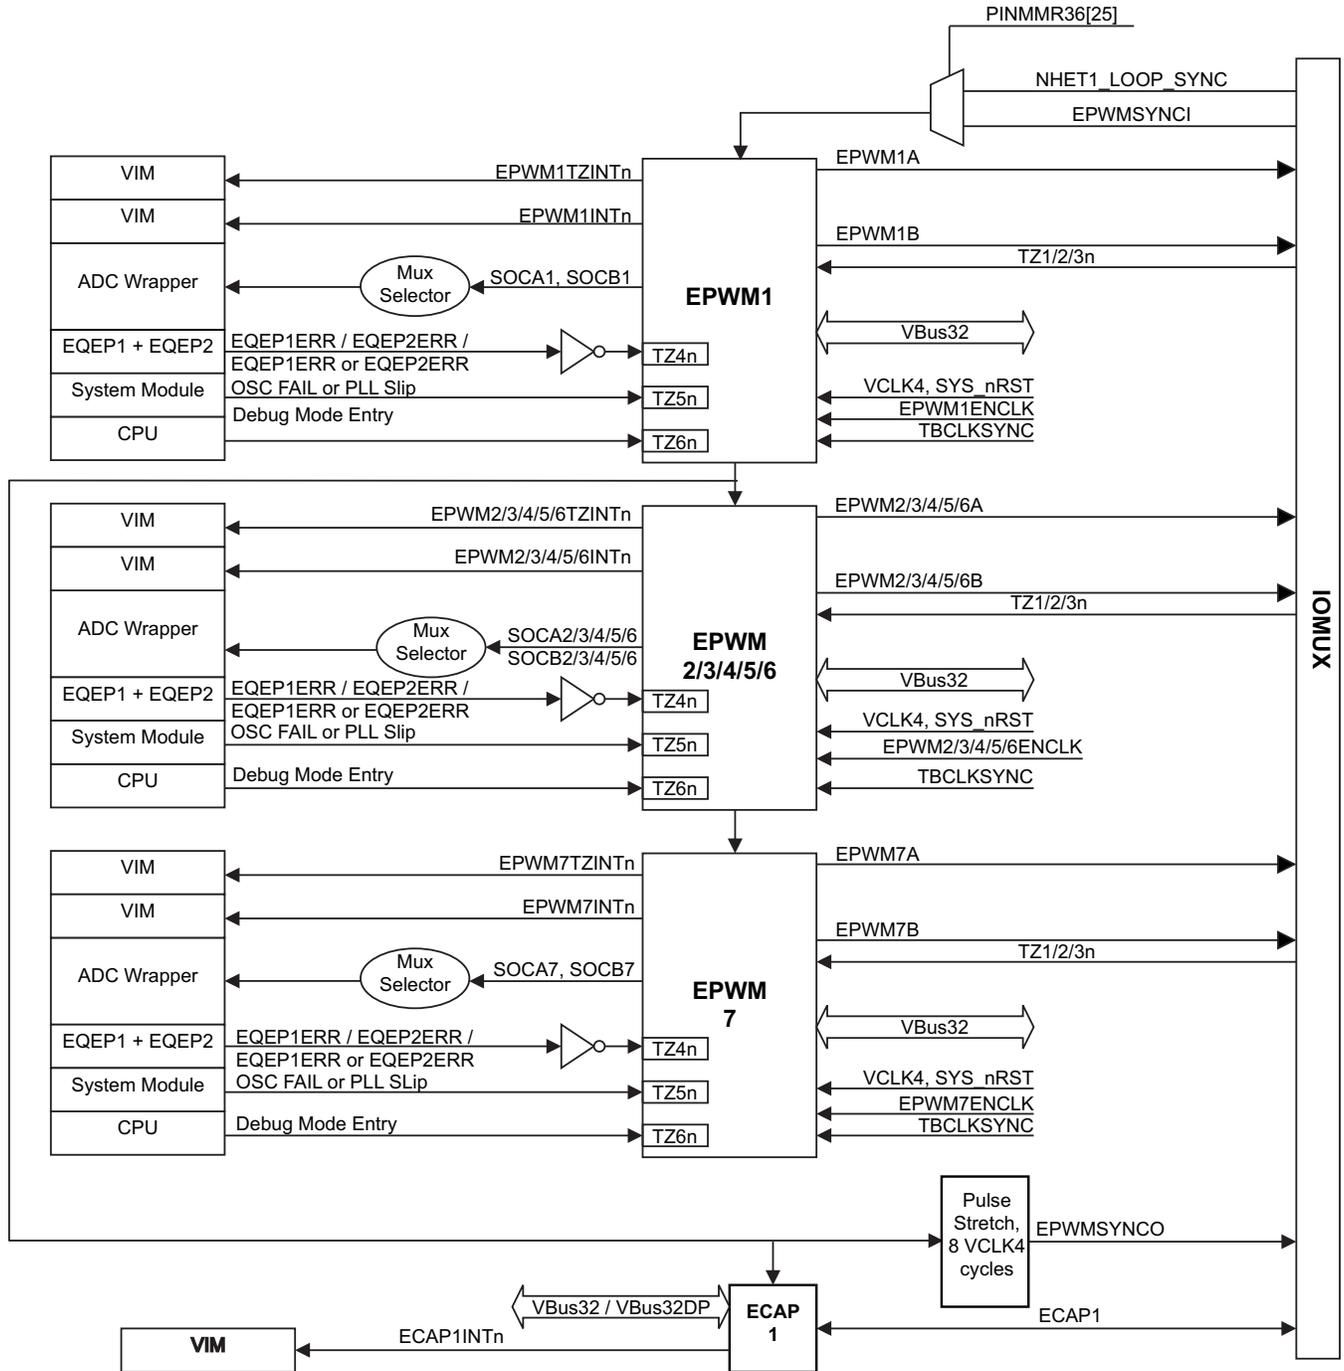

Figure 5-1. ePWMx Module Interconnections

5.1.1 ePWM Clocking and Reset

Each ePWM module has a clock enable (EPWMxENCLK). When SYS_nRST is active low, the clock enables are ignored and the ePWM logic is clocked so that it can reset to a proper state. When SYS_nRST goes in-active high, the state of clock enable is respected.

Table 5-1. ePWMx Clock Enable Control

ePWM Module Instance	Control Register to Enable Clock	Default Value
ePWM1	PINMMR37[8]	1
ePWM2	PINMMR37[16]	1
ePWM3	PINMMR37[24]	1
ePWM4	PINMMR38[0]	1
ePWM5	PINMMR38[8]	1
ePWM6	PINMMR38[16]	1
ePWM7	PINMMR38[24]	1

The default value of the control registers to enable the clocks to the ePWMx modules is 1. This means that the VCLK4 clock connections to the ePWMx modules are enabled by default. The application can choose to gate off the VCLK4 clock to any ePWMx module individually by clearing the respective control register bit.

5.1.2 Synchronization of ePWMx Time Base Counters

A time-base synchronization scheme connects all of the ePWM modules on a device. Each ePWM module has a synchronization input (EPWMxSYNCI) and a synchronization output (EPWMxSYNCO). The input synchronization for the first instance (ePWM1) comes from an external pin. Figure 5-1 shows the synchronization connections for all the ePWMx modules. Each ePWM module can be configured to use or ignore the synchronization input. Refer to the ePWM chapter in the device Technical Reference Manual for more information.

5.1.3 Synchronizing all ePWM Modules to the N2HET1 Module Time Base

The connection between the N2HET1_LOOP_SYNC and SYNCI input of ePWM1 module is implemented as shown in Figure 5-2.
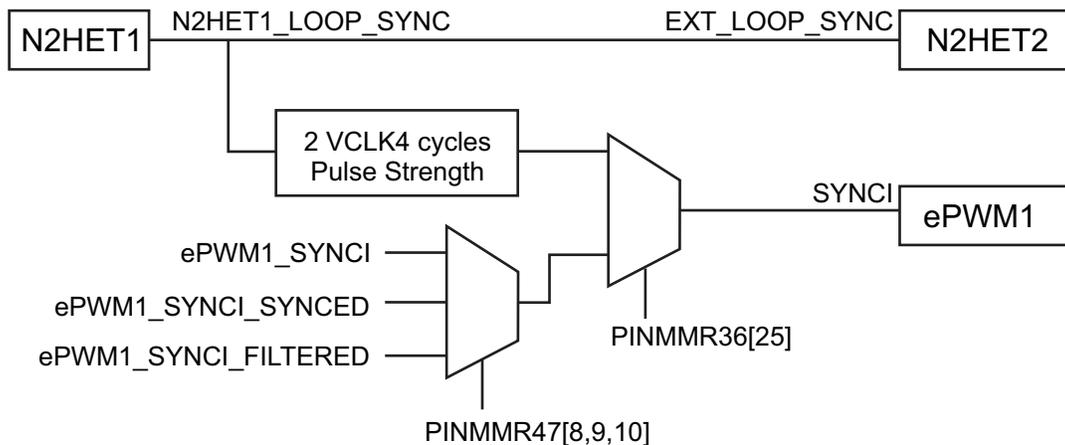

Figure 5-2. Synchronizing Time Bases Between N2HET1, N2HET2 and ePWMx Modules

<div style="writing-mode:vertical">PRODUCT PREVIEW</div>

5.1.4   Phase-Locking the Time-Base Clocks of Multiple ePWM Modules

The TBCLKSYNC bit can be used to globally synchronize the time-base clocks of all enabled ePWM modules on a device. This bit is implemented as PINMMR37 register bit 1.

When TBCLKSYNC = 0, the time-base clock of all ePWM modules is stopped. This is the default condition.

When TBCLKSYNC = 1, all ePWM time-base clocks are started with the rising edge of TBCLK aligned.

For perfectly synchronized TBCLKs, the prescaler bits in the TBCTL register of each ePWM module must be set identically. The proper procedure for enabling the ePWM clocks is as follows:

1. Enable the individual ePWM module clocks (if disable) using the control registers shown in Table 5-1.
2. Configure TBCLKSYNC = 0. This will stop the time-base clock within any enabled ePWM module.
3. Configure the prescaler values and desired ePWM modes.
4. Configure TBCLKSYNC = 1.

5.1.5   ePWM Synchronization with External Devices

The output sync from EPWM1 Module is also exported to a device output terminal so that multiple devices can be synchronized together. The signal pulse is stretched by eight VCLK4 cycles before being exported on the terminal as the EPWM1SYNCO signal.

5.1.6   ePWM Trip Zones

The ePWMx modules have six trip zone inputs each. These are active-low signals. The application can control the ePWMx module response to each of the trip zone input separately. The timing requirements from the assertion of the trip zone inputs to the actual response are specified in Section 5.1.8.

5.1.6.1   Trip Zones TZ1n, TZ2n, TZ3n

These three trip zone inputs are driven by external circuits and are connected to device-level inputs. These signals are either connected asynchronously to the ePWMx trip zone inputs, or double-synchronized with VCLK4, or double-synchronized and then filtered with a 6-cycle VCLK4-based counter before connecting to the ePWMx. By default, the trip zone inputs are asynchronously connected to the ePWMx modules.

Table 5-2. Connection to ePWMx Modules for Device-Level Trip Zone Inputs

Trip Zone Input	Control for Asynchronous Connection to ePWMx	Control for Double-Synchronized Connection to ePWMx	Control for Double-Synchronized and Filtered Connection to ePWMx
TZ1n	PINMMR46[16] = 1	PINMMR46[16] = 0 AND PINMMR46[17] = 1	PINMMR46[16] = 0 AND PINMMR46[17] = 0 AND PINMMR46[18] = 1
TZ2n	PINMMR46[24] = 1	PINMMR46[24] = 0 AND PINMMR46[25] = 1	PINMMR46[24] = 0 AND PINMMR46[25] = 0 AND PINMMR46[26] = 1
TZ3n	PINMMR47[0] = 1	PINMMR47[0] = 0 AND PINMMR47[1] = 1	PINMMR47[0] = 0 AND PINMMR47[1] = 0 AND PINMMR47[2] = 1

5.1.6.2   Trip Zone TZ4n

This trip zone input is dedicated to eQEPx error indications. There are two eQEP modules on this device. Each eQEP module indicates a phase error by driving its EQEPxERR output High. The following control registers allow the application to configure the trip zone input (TZ4n) to each ePWMx module based on the application's requirements.

5.1.6.3 Trip Zone TZ5n

This trip zone input is dedicated to a clock failure on the device. That is, this trip zone input is asserted whenever an oscillator failure or a PLL slip is detected on the device. The application can use this trip zone input for each ePWMx module in order to prevent the external system from going out of control when the device clocks are not within expected range (system running at limp clock).

The oscillator failure and PLL slip signals used for this trip zone input are taken from the status flags in the system module. These are level signals are set until cleared by the application.

5.1.6.4 Trip Zone TZ6n

This trip zone input to the ePWMx modules is dedicated to a debug mode entry of the CPU. If enabled, the user can force the PWM outputs to a known state when the emulator stops the CPU. This prevents the external system from going out of control when the CPU is stopped.

5.1.7 Triggering of ADC Start of Conversion Using ePWMx SOCA and SOCB Outputs

A special scheme is implemented in order to select the actual signal used for triggering the start of conversion on the two ADCs on this device. This scheme is defined in Section 5.4.2.3.

PRODUCT PREVIEW

5.2 Enhanced Capture Modules (eCAP)

Figure 5-3 shows how the eCAP modules are interconnected on this microcontroller.
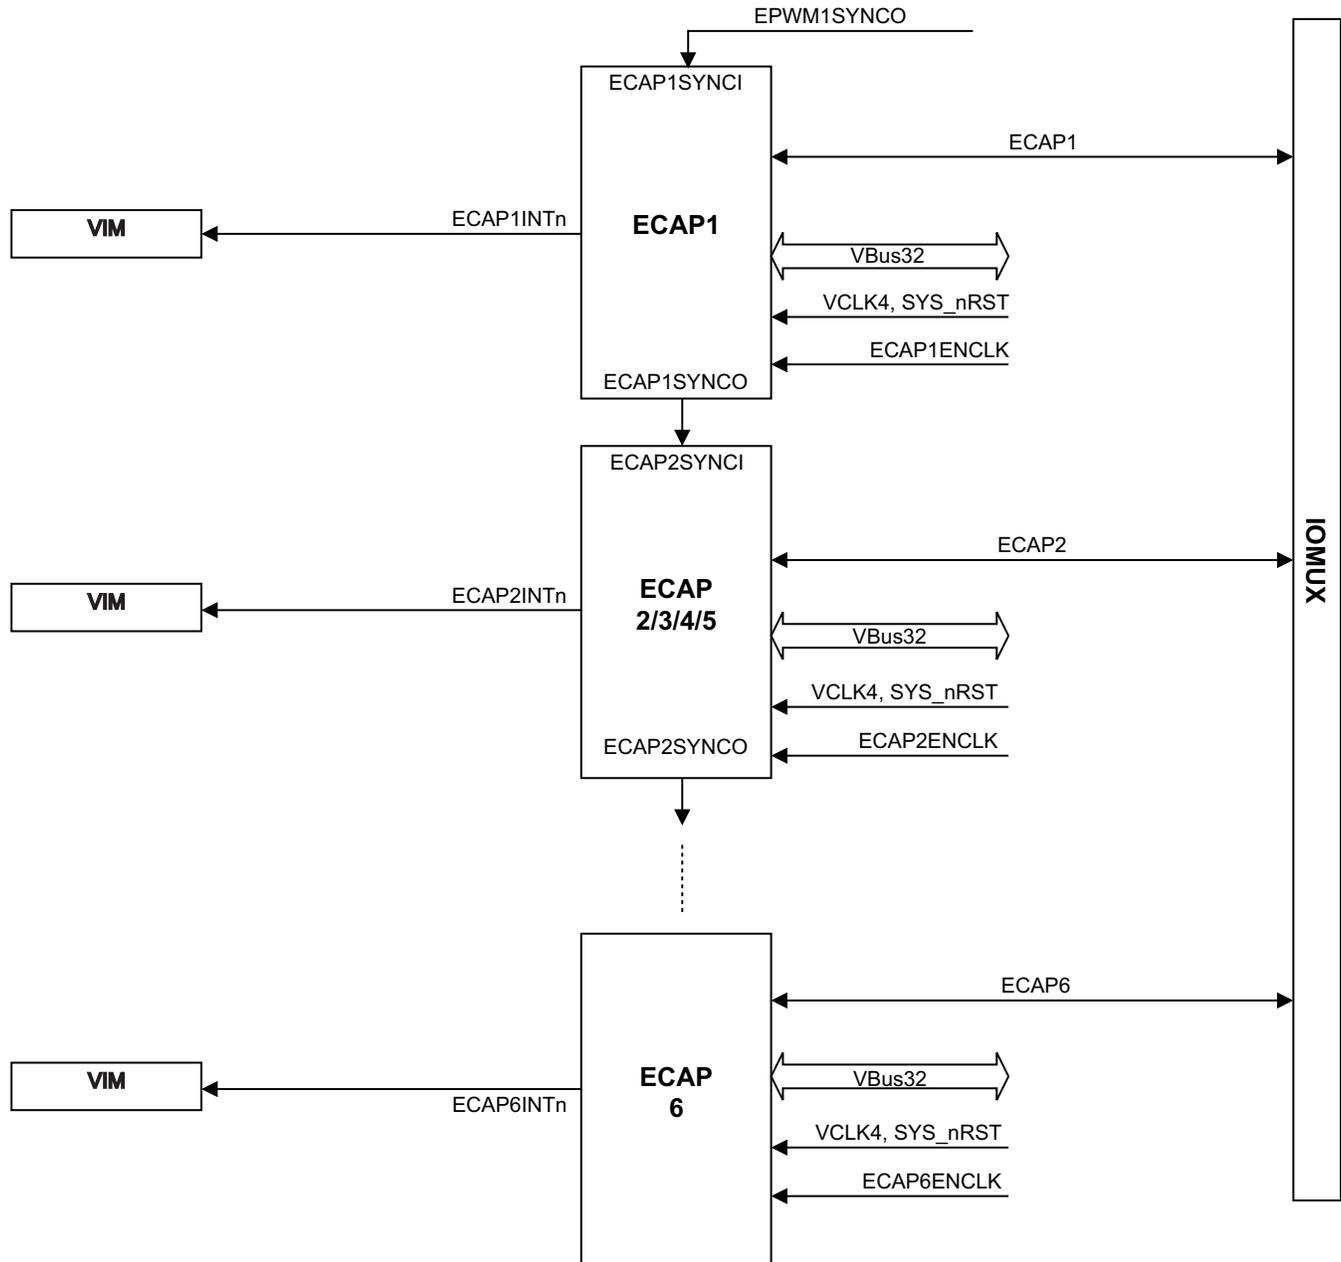

Figure 5-3. eCAP Module Connections

5.2.1 Clock Enable Control for eCAPx Modules

Each of the ECAPx modules have a clock enable (ECAPxENCLK). These signals need to be generated from a device-level control register. When SYS_nRST is active low, the clock enables are ignored and the ECAPx logic is clocked so that it can reset to a proper state. When SYS_nRST goes in-active high, the state of clock enable is respected.

Table 5-7. eCAPx Clock Enable Control

ePWM Module Instance	Control Register to Enable Clock	Default Value
eCAP1	PINMMR39[0]	1
eCAP2	PINMMR39[8]	1
eCAP3	PINMMR39[16]	1
eCAP4	PINMMR39[24]	1
eCAP5	PINMMR40[0]	1
eCAP6	PINMMR40[8]	1

The default value of the control registers to enable the clocks to the eCAPx modules is 1. This means that the VCLK4 clock connections to the eCAPx modules are enabled by default. The application can choose to gate off the VCLK4 clock to any eCAPx module individually by clearing the respective control register bit.

5.2.2 PWM Output Capability of eCAPx

When not used in capture mode, each of the eCAPx modules can be used as a single-channel PWM output. This is called the auxiliary PWM (APWM) mode of operation of the eCAP modules. Refer to the eCAP chapter of the device Technical Reference Manual for more information.

5.2.3 Input Connection to eCAPx Modules

The input connection to each of the eCAP modules can be selected between a double-VCLK4-synchronized input or a double-VCLK4-synchronized and filtered input, as shown in Table 5-8.

Table 5-8. Device-Level Input Connection to eCAPx Modules

Input Signal	Control for Double-Synchronized Connection to eCAPx	Control for Double-Synchronized and Filtered Connection to eCAPx
eCAP1	PINMMR43[0] = 1	PINMMR43[0] = 0 AND PINMMR43[1] = 1
eCAP2	PINMMR43[8] = 1	PINMMR43[8] = 0 AND PINMMR43[9] = 1
eCAP3	PINMMR43[16] = 1	PINMMR43[16] = 0 AND PINMMR43[17] = 1
eCAP4	PINMMR43[24] = 1	PINMMR43[24] = 0 AND PINMMR43[25] = 1
eCAP5	PINMMR44[0] = 1	PINMMR44[0] = 0 AND PINMMR44[1] = 1
eCAP6	PINMMR44[8] = 1	PINMMR44[8] = 0 AND PINMMR44[9] = 1

5.2.4 Enhanced Capture Module (eCAP) Timings

Table 5-9. eCAPx Timing Requirements

	PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(CAP)}$	Capture input pulse width	Synchronous	$2\ t_{c(VCLK4)}$		cycles
		Synchronous, with input filter	$2\ t_{c(VCLK4)}$ + filter width		cycles

Table 5-10. eCAPx Switching Characteristics

	PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(APWM)}$	Pulse duration, APWMx output high or low		20		ns

PRODUCT PREVIEW

5.3 Enhanced Quadrature Encoder (eQEP)

Figure 5-4 shows the eQEP module interconnections on the device.
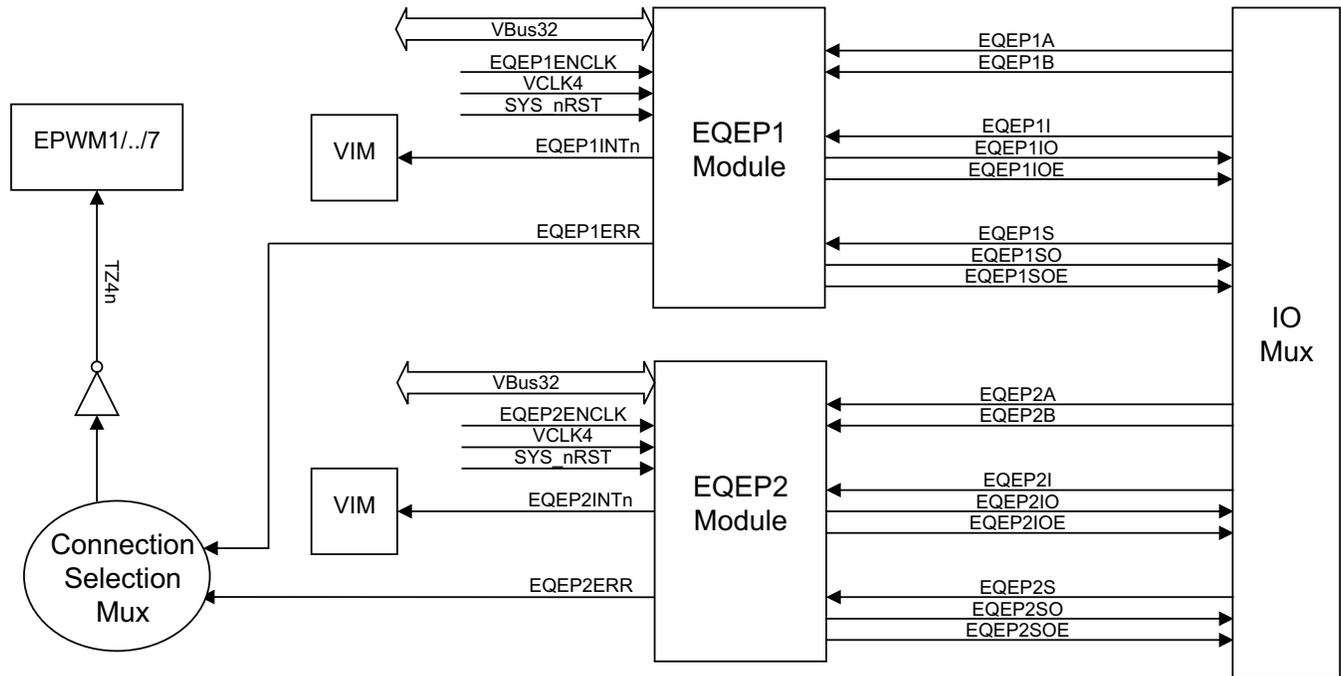

Figure 5-4. eQEP Module Interconnections

5.3.1 Clock Enable Control for eQEPx Modules

Device-level control registers are implemented to generate the EQEPxENCLK signals. When SYS_nRST is active low, the clock enables are ignored and the eQEPx logic is clocked so that it can reset to a proper state. When SYS_nRST goes in-active high, the state of clock enable is respected.

Table 5-11. eQEPx Clock Enable Control

ePWM Module Instance	Control Register to Enable Clock	Default Value
eQEP1	PINMMR40[16]	1
eQEP2	PINMMR40[24]	1

The default value of the control registers to enable the clocks to the eQEPx modules is 1. This means that the VCLK4 clock connections to the eQEPx modules are enabled by default. The application can choose to gate off the VCLK4 clock to any eQEPx module individually by clearing the respective control register bit.

5.3.2 Using eQEPx Phase Error to Trip ePWMx Outputs

The eQEP module sets the EQEPERR signal output whenever a phase error is detected in its inputs EQEPxA and EQEPxB. This error signal from both the eQEP modules is input to the connection selection multiplexor. This multiplexor is defined in Table 5-3. As shown in Figure 5-1, the output of this selection multiplexor is inverted and connected to the TZ4n trip-zone input of all EPWMx modules. This connection allows the application to define the response of each ePWMx module on a phase error indicated by the eQEP modules.

5.3.3 Input Connections to eQEPx Modules

The input connections to each of the eQEP modules can be selected between a double-VCLK4-synchronized input or a double-VCLK4-synchronized and filtered input, as shown in Table 5-12.

Table 5-12. Device-Level Input Connection to eCAPx Modules

Input Signal	Control for Double-Synchronized Connection to eQEPx	Control for Double-Synchronized and Filtered Connection to eQEPx
eQEP1A	PINMMR44[16] = 1	PINMMR44[16] = 0 and PINMMR44[17] = 1

PRODUCT PREVIEW

5.4 Multi-Buffered 12bit Analog-to-Digital Converter

The multibuffered A-to-D converter (MibADC) has a separate power bus for its analog circuitry that enhances the A-to-D performance by preventing digital switching noise on the logic circuitry which could be present on V_{SS} and V_{CC} from coupling into the A-to-D analog stage. All A-to-D specifications are given with respect to AD_{REFLO} unless otherwise noted.

Table 5-15. MibADC Overview

Description	Value
Resolution	12 bits
Monotonic	Assured
Output conversion code	00h to 3FFh [00 for $V_{AI} \leq AD_{REFLO}$; 3FFh for $V_{AI} \geq AD_{REFHI}$]

5.4.1 Features

- 12-bit resolution
- AD_{REFHI} and AD_{REFLO} pins (high and low reference voltages)
- Total Sample/Hold/Convert time: 600ns Minimum at 30MHz ADCLK
- One memory region per conversion group is available (event, group 1, group 2)
- Allocation of channels to conversion groups is completely programmable
- Supports flexible channel conversion order
- Memory regions are serviced either by interrupt or by DMA
- Programmable interrupt threshold counter is available for each group
- Programmable magnitude threshold interrupt for each group for any one channel
- Option to read either 8-bit, 10-bit or 12-bit values from memory regions
- Single or continuous conversion modes
- Embedded self-test
- Embedded calibration logic
- Enhanced power-down mode
  - Optional feature to automatically power down ADC core when no conversion is in progress
- External event pin (ADxEVT) programmable as general-purpose I/O

5.4.2 Event Trigger Options

The ADC module supports 3 conversion groups: Event Group, Group1 and Group2. Each of these 3 groups can be configured to be hardware event-triggered. In that case, the application can select from among 8 event sources to be the trigger for a group's conversions.

5.4.2.1 MIBADC1 Event Trigger Hookup

Table 5-16. MIBADC1 Event Trigger Hookup

Group Source Select, G1SRC, G2SRC or EVSRC	Event #	Trigger Event Signal				
		PINMMR30[0] = 1 (default)	PINMMR30[0] = 0 and PINMMR30[1] = 1			
			Option A	Control for Option A	Option B	Control for Option B
000	1	AD1EVT	AD1EVT	—	AD1EVT	—
001	2	N2HET1[8]	N2HET2[5]	PINMMR30[8] = 1	ePWM_B	PINMMR30[8] = 0 and PINMMR30[9] = 1
010	3	N2HET1[10]	N2HET1[27]	—	N2HET1[27]	—

Table 5-16. MIBADC1 Event Trigger Hookup (continued)

011	4	RTI Compare 0 Interrupt	RTI Compare 0 Interrupt	PINMMR30[16] = 1	ePWM_A1	PINMMR30[16] = 0 and PINMMR30[17] = 1
100	5	N2HET1[12]	N2HET1[17]	—	N2HET1[17]	—
101	6	N2HET1[14]	N2HET1[19]	PINMMR30[24] = 1	N2HET2[1]	PINMMR30[24] = 0 and PINMMR30[25] = 1
110	7	GIOB[0]	N2HET1[11]	PINMMR31[0] = 1	ePWM_A2	PINMMR31[0] = 0 and PINMMR31[1] = 1
111	8	GIOB[1]	N2HET2[13]	PINMMR31[8] = 1	ePWM_AB	PINMMR31[8] = 0 and PINMMR31[9] = 1

NOTE

If ADEVT, N2HET1 or GIOB is used as a trigger source, the connection to the MibADC1 module trigger input is made from the output side of the input buffer. This way, a trigger condition can be generated either by configuring the function as output onto the pad (via the mux control), or by driving the function from an external trigger source as input. If the mux control module is used to select different functionality instead of the ADEVT, N2HET1[x] or GIOB[x] signals, then care must be taken to disable these signals from triggering conversions; there is no multiplexing on the input connections.

If N2HET2[5], ePWM_B, N2HET1[17], N2HET1[19], N2HET2[1], N2HET1[11], ePWM_S2, N2HET2[13] or ePWM_AB is used to trigger the ADC the connection to the ADC is made directly from the N2HETx or ePWM module outputs. As a result, the ADC can be triggered without having to enable the signal from being output on a device terminal.

NOTE

For the RTI compare 0 interrupt source, the connection is made directly from the output of the RTI module. That is, the interrupt condition can be used as a trigger source even if the actual interrupt is not signaled to the CPU.

5.4.2.2 MIBADC2 Event Trigger Hookup

Table 5-17. MIBADC2 Event Trigger Hookup

Group Source Select, G1SRC, G2SRC or EVSRC	Event #	Trigger Event Signal				
		PINMMR30[0] = 1 (default)	PINMMR30[0] = 0 and PINMMR30[1] = 1			
			Option A	Control for Option A	Option B	Control for Option B
000	1	AD2EVT	AD1EVT	—	AD1EVT	—
001	2	N2HET1[8]	N2HET2[5]	PINMMR31[16] = 1	ePWM_B	PINMMR31[16] = 0 and PINMMR31[17] = 1
010	3	N2HET1[10]	N2HET1[27]	—	N2HET1[27]	—
011	4	RTI Compare 0 Interrupt	RTI Compare 0 Interrupt	PINMMR31[24] = 1	ePWM_A1	PINMMR31[24] = 0 and PINMMR31[25] = 1
100	5	N2HET1[12]	N2HET1[17]	—	N2HET1[17]	—
101	6	N2HET1[14]	N2HET1[19]	PINMMR32[0] = 1	N2HET2[1]	PINMMR32[0] = 0 and PINMMR32[1] = 1

NOTE

If AD2EVT, N2HET1 or GIOB is used as a trigger source, the connection to the MibADC2 module trigger input is made from the output side of the input buffer. This way, a trigger condition can be generated either by configuring the function as output onto the pad (via the mux control), or by driving the function from an external trigger source as input. If the mux control module is used to select different functionality instead of the AD2EVT, N2HET1[x] or GIOB[x] signals, then care must be taken to disable these signals from triggering conversions; there is no multiplexing on the input connections.

If N2HET2[5], ePWM_B, N2HET1[17], N2HET1[19], N2HET2[1], N2HET1[11], ePWM_S2, N2HET2[13] or ePWM_AB is used to trigger the ADC the connection to the ADC is made directly from the N2HETx or ePWM module outputs. As a result, the ADC can be triggered without having to enable the signal from being output on a device terminal.

NOTE

For the RTI compare 0 interrupt source, the connection is made directly from the output of the RTI module. That is, the interrupt condition can be used as a trigger source even if the actual interrupt is not signaled to the CPU.

5.4.2.3 Controlling ADC1 and ADC2 Event Trigger Options Using SOC Output from ePWM Modules

As shown in Figure 5-5, the ePWMxSOCA and ePWMxSOCB outputs from each ePWM module are used to generate 4 signals – ePWM_B, ePWM_A1, ePWM_A2 and ePWM_AB, that are available to trigger the ADC based on the application requirement.

Table 5-21. MibADC Timing Specifications

Parameter		MIN	NOM	MAX	Unit
$t_{c(ADCLK)}$ [1]	Cycle time, MibADC clock	0.033			µs
$t_{d(SH)}$ [2]	Delay time, sample and hold time	0.2			µs
12-bit mode					
$t_{d(C)}$	Delay time, conversion time	0.4			µs
$t_{d(SHC)}$ [3]	Delay time, total sample/hold and conversion time	0.6			µs
10-bit mode					
$t_{d(C)}$	Delay time, conversion time	0.33			µs
$t_{d(SHC)}$ [3]	Delay time, total sample/hold and conversion time	0.53			µs

(1) The MibADC clock is the ADCLK, generated by dividing down the VCLK by a prescale factor defined by the ADCLOCKCR register bits 4:0.
(2) The sample and hold time for the ADC conversions is defined by the ADCLK frequency and the AD<GP>SAMP register for each conversion group. The sample time needs to be determined by accounting for the external impedance connected to the input channel as well as the ADC's internal impedance.
(3) This is the minimum sample/hold and conversion time that can be achieved. These parameters are dependent on many factors, e.g the prescale settings.

Table 5-22. MibADC Operating Characteristics Over Full Ranges of Recommended Operating Conditions[1][2]

	Parameter	Description/Conditions		MIN	Type	MAX	Unit
CR	Conversion range over which specified accuracy is maintained	$AD_{REFHI} - AD_{REFLO}$		3		5.5	V
Z_{SET}	Zero Scale Offset	Difference between the first ideal transition (from code 000h to 001h) and the actual transition	10-bit mode			1	LSB
			12-bit mode			2	LSB
F_{SET}	Full Scale Offset	Difference between the range of the measured code transitions (from first to last) and the range of the ideal code transitions	10-bit mode			2	LSB
			12-bit mode			3	LSB
E_{DNL}	Differential nonlinearity error	Difference between the actual step width and the ideal value. (See Figure 76)	10-bit mode			± 1.5	LSB
			12-bit mode			± 2	LSB
E_{INL}	Integral nonlinearity error	Maximum deviation from the best straight line through the MibADC. MibADC transfer characteristics, excluding the quantization error.	10-bit mode			± 2	LSB
			12-bit mode			± 2	LSB
E_{TOT}	Total unadjusted error (after calibration)	Maximum value of the difference between an analog value and the ideal midstep value.	10-bit mode			± 2	LSB
			12-bit mode			± 4	LSB

(1)   1 LSB = $(AD_{REFHI} - AD_{REFLO})/ 2^{12}$ for 12-bit mode
(2)   1 LSB = $(AD_{REFHI} - AD_{REFLO})/ 2^{10}$ for 10-bit mode

PRODUCT PREVIEW

5.4.4 Performance (Accuracy) Specifications

5.4.4.1 MibADC Nonlinearity Errors

The differential nonlinearity error shown in Figure 5-7 (sometimes referred to as differential linearity) is the difference between an actual step width and the ideal value of 1 LSB.

NOTE A: 1 LSB = $(AD_{REFHI} - AD_{REFLO})/2^{12}$
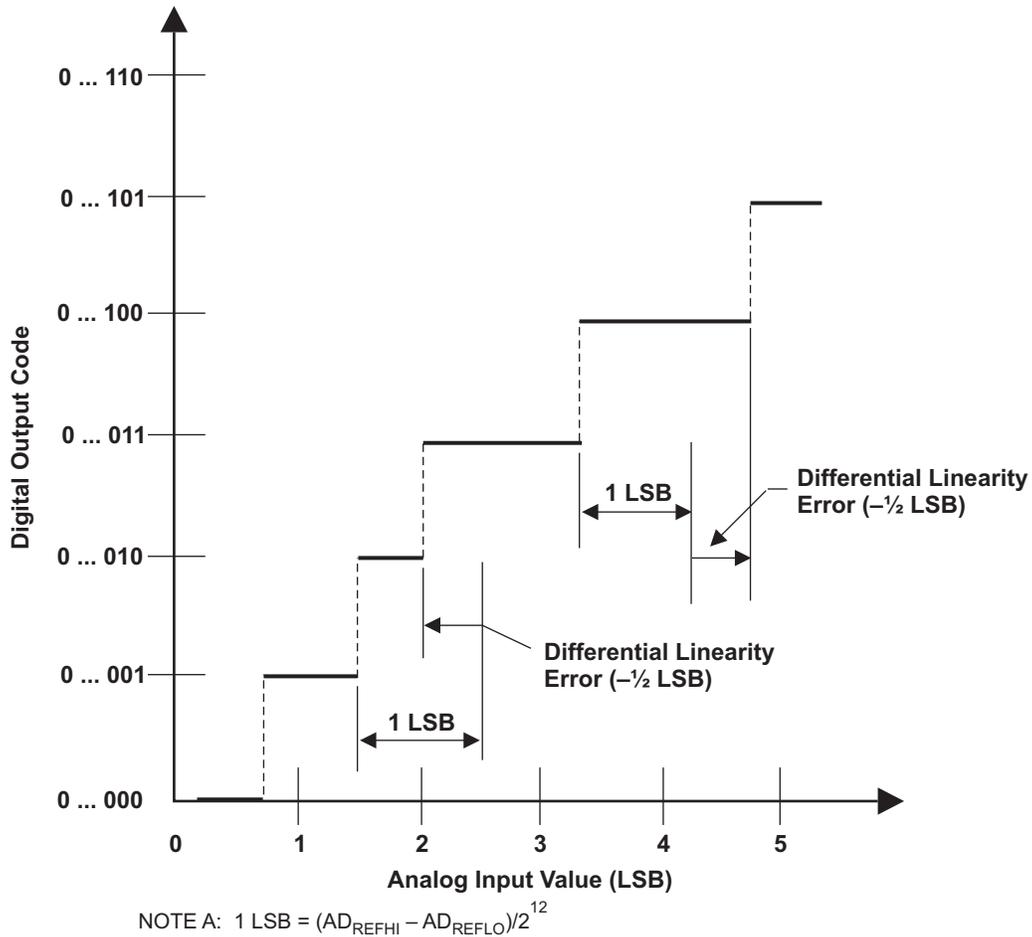

Figure 5-7. Differential Nonlinearity (DNL) Error

The integral nonlinearity error shown in Figure 5-8 (sometimes referred to as linearity error) is the deviation of the values on the actual transfer function from a straight line.

NOTE A: 1 LSB = $(AD_{REFHI} - AD_{REFLO})/2^{12}$
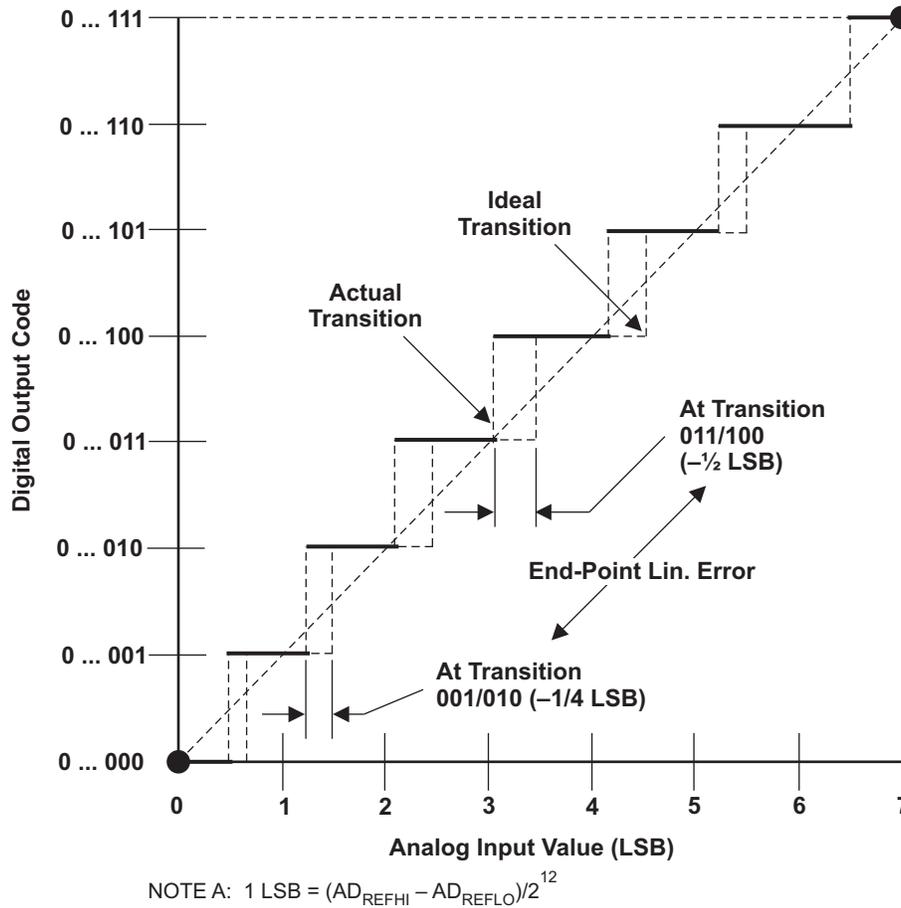

Figure 5-8. Integral Nonlinearity (INL) Error

5.4.4.2 MibADC Total Error

The absolute accuracy or total error of an MibADC as shown in Figure 5-9 is the maximum value of the difference between an analog value and the ideal midstep value.

NOTE A: 1 LSB = $(AD_{REFHI} - AD_{REFLO})/2^{12}$
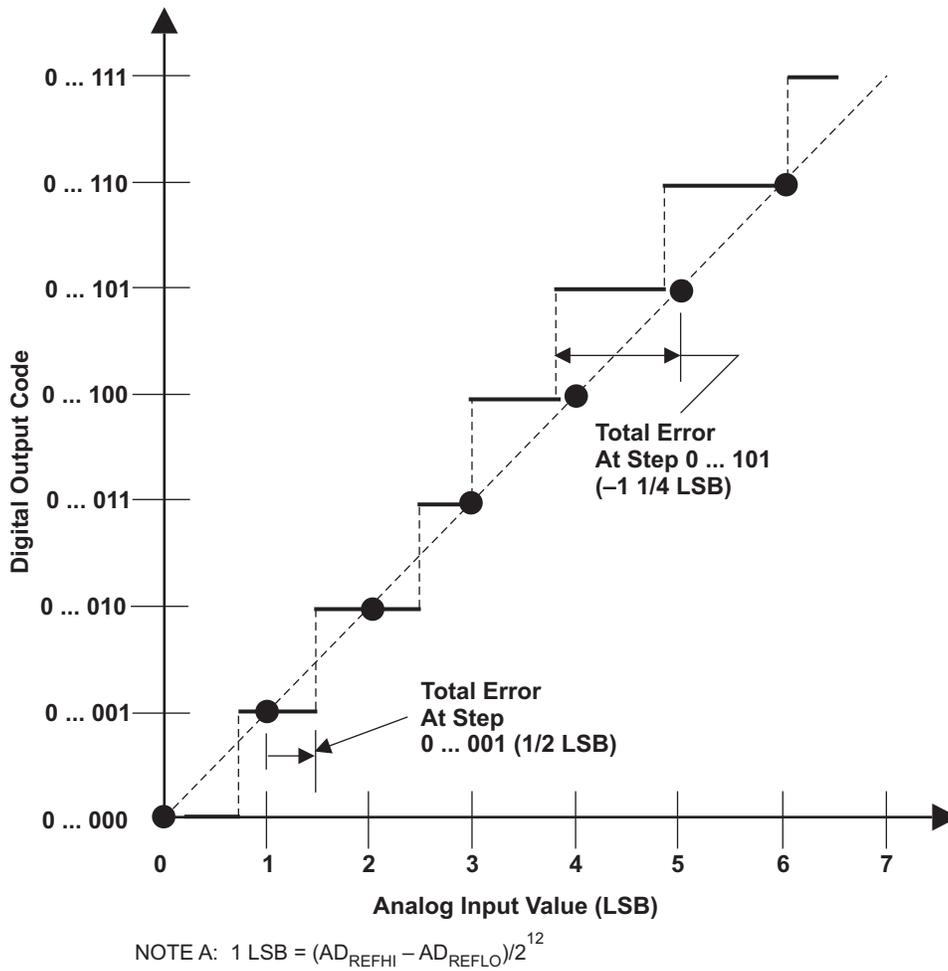

Figure 5-9. Absolute Accuracy (Total) Error

5.5 General-Purpose Input/Output

The GPIO module on this device supports two ports, GIOA and GIOB. The I/O pins are bidirectional and bit-programmable. Both GIOA and GIOB support external interrupt capability.

5.5.1 Features

The GPIO module has the following features:

- Each IO pin can be configured as:
  - Input
  - Output
  - Open Drain
- The interrupts have the following characteristics:
  - Programmable interrupt detection either on both edges or on a single edge (set in GIOINTDET)
  - Programmable edge-detection polarity, either rising or falling edge (set in GIOPOL register)
  - Individual interrupt flags (set in GIOFLG register)
  - Individual interrupt enables, set and cleared through GIOENASET and GIOENACLR registers respectively
  - Programmable interrupt priority, set through GIOLVLSET and GIOLVLCLR registers
- Internal pullup/pulldown allows unused I/O pins to be left unconnected

For information on input and output timings see Section 3.8 and Section 3.9

PRODUCT PREVIEW

5.6 Enhanced High-End Timer (N2HET)

The N2HET is an advanced intelligent timer that provides sophisticated timing functions for real-time applications. The timer is software-controlled, using a reduced instruction set, with a specialized timer micromachine and an attached I/O port. The N2HET can be used for pulse width modulated outputs, capture or compare inputs, or general-purpose I/O.. It is especially well suited for applications requiring multiple sensor information and drive actuators with complex and accurate time pulses.

5.6.1 Features

The N2HET module has the following features:

- Programmable timer for input and output timing functions
- Reduced instruction set (30 instructions) for dedicated time and angle functions
- 160 words of instruction RAM protected by parity
- User defined number of 25-bit virtual counters for timer, event counters and angle counters
- 7-bit hardware counters for each pin allow up to 32-bit resolution in conjunction with the 25-bit virtual counters
- Up to 32 pins usable for input signal measurements or output signal generation
- Programmable suppression filter for each input pin with adjustable limiting frequency
- Low CPU overhead and interrupt load
- Efficient data transfer to or from the CPU memory with dedicated High-End-Timer Transfer Unit (HTU) or DMA
- Diagnostic capabilities with different loopback mechanisms and pin status readback functionality

5.6.2 N2HET RAM Organization

The timer RAM uses 4 RAM banks, where each bank has two port access capability. This means that one RAM address may be written while another address is read. The RAM words are 96-bits wide, which are split into three 32-bit fields (program, control, and data).

5.6.3 Input Timing Specifications

The N2HET instructions PCNT and WCAP impose some timing constraints on the input signals.
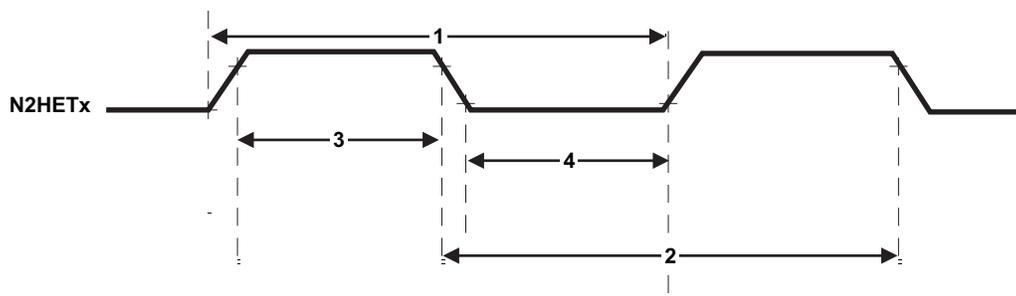

Figure 5-10. N2HET Input Capture Timings

Table 5-23. Dynamic Characteristics for the N2HET Input Capture Functionality

	PARAMETER	MIN	MAX	UNIT
1	Input signal period, PCNT or WCAP for rising edge to rising edge	(HRP) (LRP) $tc_{(VCLK2)}$ + 2	2^{25} (HRP) (LRP) $tc_{(VCLK2)}$ - 2	ns
2	Input signal period, PCNT or WCAP for falling edge to falling edge	(HRP) (LRP) $tc_{(VCLK2)}$ + 2	2^{25} (HRP) (LRP) $tc_{(VCLK2)}$ - 2	ns
3	Input signal high phase, PCNT or WCAP for rising edge to falling edge	2 (HRP) $tc_{(VCLK2)}$ + 2	2^{25} (HRP) (LRP) $tc_{(VCLK2)}$ - 2	ns
4	Input signal low phase, PCNT or WCAP for falling edge to rising edge	2 (HRP) $tc_{(VCLK2)}$ + 2	2^{25} (HRP) (LRP) $tc_{(VCLK2)}$ - 2	ns

5.6.4 N2HET1-N2HET2 Synchronization

In some applications the N2HET resolutions must be synchronized. Some other applications require a single time base to be used for all PWM outputs and input timing captures.

The N2HET provides such a synchronization mechanism. The Clk_master/slave (HETGCR.16) configures the N2HET in master or slave mode (default is slave mode). A N2HET in master mode provides a signal to synchronize the prescalers of the slave N2HET. The slave N2HET synchronizes its loop resolution to the loop resolution signal sent by the master. The slave does not require this signal after it receives the first synchronization signal. However, anytime the slave receives the re-synchronization signal from the master, the slave must synchronize itself again..
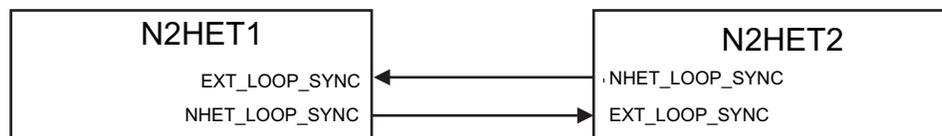

Figure 5-11. N2HET1 – N2HET2 Synchronization Hookup

5.6.5 N2HET Checking

5.6.5.1 Internal Monitoring

To assure correctness of the high-end timer operation and output signals, the two N2HET modules can be used to monitor each other's signals as shown in Figure 5-12. The direction of the monitoring is controlled by the I/O multiplexing control module.
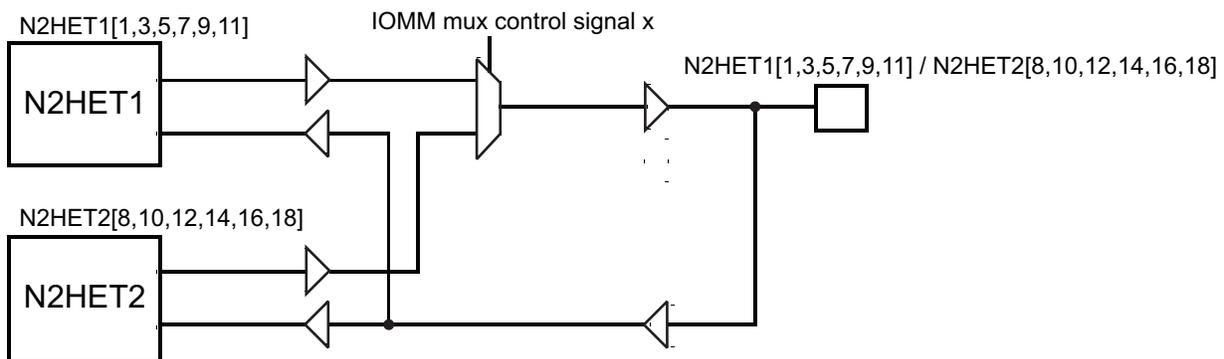

Figure 5-12. N2HET Monitoring

5.6.5.2 Output Monitoring using Dual Clock Comparator (DCC)

N2HET1[31] is connected as a clock source for counter 1 in DCC1. This allows the application to measure the frequency of the pulse-width modulated (PWM) signal on N2HET1[31].

PRODUCT PREVIEW

RM46L430
RM46L830

TEXAS
INSTRUMENTS

SPNS182 – SEPTEMBER 2012

www.ti.com

Similarly, N2HET2[0] is connected as a clock source for counter 1 in DCC2. This allows the application to measure the frequency of the pulse-width modulated (PWM) signal on N2HET2[0].

Both N2HET1[31] and N2HET2[0] can be configured to be internal-only channels. That is, the connection to the DCC module is made directly from the output of the N2HETx module (from the input of the output buffer).

For more information on DCC see Section 4.7.3.

5.6.6 Disabling N2HET Outputs

Some applications require the N2HET outputs to be disabled under some fault condition. The N2HET module provides this capability via the "Pin Disable" input signal. This signal, when driven low, causes the N2HET outputs identified by a programmable register (HETPINDIS) to be tri-stated. Please refer to the device Terminal Reference Manual for more details on the "N2HET Pin Disable" feature.

GIOA[5] is connected to the "Pin Disable" input for N2HET1, and GIOB[2] is connected to the "Pin Disable" input for N2HET2.

PRODUCT PREVIEW

5.6.7 High-End Timer Transfer Unit (HET-TU)

A High End Timer Transfer Unit (HET-TU) can perform DMA type transactions to transfer N2HET data to or from main memory. A Memory Protection Unit (MPU) is built into the HET-TU.

5.6.7.1 Features

- CPU and DMA independent
- Master Port to access system memory
- 8 control packets supporting dual buffer configuration
- Control packet information is stored in RAM protected by parity
- Event synchronization (HET transfer requests)
- Supports 32 or 64 bit transactions
- Addressing modes for HET address (8 byte or 16 byte) and system memory address (fixed, 32 bit or 64bit)
- One shot, circular and auto switch buffer transfer modes
- Request lost detection

5.6.7.2 Trigger Connections

5.7 Controller Area Network (DCAN)

The DCAN supports the CAN 2.0B protocol standard and uses a serial, multimaster communication protocol that efficiently supports distributed real-time control with robust communication rates of up to 1 megabit per second (Mbps). The DCAN is ideal for applications operating in noisy and harsh environments (e.g., automotive and industrial fields) that require reliable serial communication or multiplexed wiring.

5.7.1 Features

Features of the DCAN module include:

- Supports CAN protocol version 2.0 part A, B
- Bit rates up to 1 MBit/s
- The CAN kernel can be clocked by the oscillator for baud-rate generation.
- 64 mailboxes on each DCAN
- Individual identifier mask for each message object
- Programmable FIFO mode for message objects
- Programmable loop-back modes for self-test operation
- Automatic bus on after Bus-Off state by a programmable 32-bit timer
- Message RAM protected by parity
- Direct access to Message RAM during test mode
- CAN Rx / Tx pins configurable as general purpose IO pins
- Message RAM Auto Initialization
- DMA support

For more information on the DCAN see the device Technical Reference Manual.

5.7.2 Electrical and Timing Specifications

Table 5-26. Dynamic Characteristics for the DCANx TX and RX pins

Parameter		MIN	MAX	Unit
$t_{d(CANnTX)}$	Delay time, transmit shift register to CANnTX pin[1]		15	ns
$t_{d(CANnRX)}$	Delay time, CANnRX pin to receive shift register		5	ns

(1) These values do not include rise/fall times of the output buffer.

5.8 Local Interconnect Network Interface (LIN)

The SCI/LIN module can be programmed to work either as an SCI or as a LIN. The core of the module is an SCI. The SCI's hardware features are augmented to achieve LIN compatibility.

The SCI module is a universal asynchronous receiver-transmitter that implements the standard nonreturn to zero format. The SCI can be used to communicate, for example, through an RS-232 port or over a K-line.

The LIN standard is based on the SCI (UART) serial data link format. The communication concept is single-master/multiple-slave with a message identification for multi-cast transmission between any network nodes.

5.8.1 LIN Features

The following are features of the LIN module:
- Compatible to LIN 1.3, 2.0 and 2.1 protocols
- Multi-buffered receive and transmit units DMA capability for minimal CPU intervention
- Identification masks for message filtering
- Automatic Master Header Generation
  - Programmable Synch Break Field
  - Synch Field
  - Identifier Field
- Slave Automatic Synchronization
  - Synch break detection
  - Optional baudrate update
  - Synchronization Validation
- 2^{31} programmable transmission rates with 7 fractional bits
- Error detection
- 2 Interrupt lines with priority encoding

5.9 Serial Communication Interface (SCI)

5.9.1 Features

- Standard universal asynchronous receiver-transmitter (UART) communication
- Supports full- or half-duplex operation
- Standard nonreturn to zero (NRZ) format
- Double-buffered receive and transmit functions
- Configurable frame format of 3 to 13 bits per character based on the following:
  - Data word length programmable from one to eight bits
  - Additional address bit in address-bit mode
  - Parity programmable for zero or one parity bit, odd or even parity
  - Stop programmable for one or two stop bits
- Asynchronous or isosynchronous communication modes
- Two multiprocessor communication formats allow communication between more than two devices.
- Sleep mode is available to free CPU resources during multiprocessor communication.
- The 24-bit programmable baud rate supports 2^{24} different baud rates provide high accuracy baud rate selection.
- Four error flags and Five status flags provide detailed information regarding SCI events.
- Capability to use DMA for transmit and receive data.

5.10 Inter-Integrated Circuit (I2C)

The inter-integrated circuit (I2C) module is a multi-master communication module providing an interface between the TMS570 microcontroller and devices compliant with Philips Semiconductor I2C-bus specification version 2.1 and connected by an I2C-bus. This module will support any slave or master I2C compatible device.

5.10.1 Features

The I2C has the following features:

- Compliance to the Philips I2C bus specification, v2.1 (The I2C Specification, Philips document number 9398 393 40011)
  - Bit/Byte format transfer
  - 7-bit and 10-bit device addressing modes
  - General call
  - START byte
  - Multi-master transmitter/ slave receiver mode
  - Multi-master receiver/ slave transmitter mode
  - Combined master transmit/receive and receive/transmit mode
  - Transfer rates of 10 kbps up to 400 kbps (Phillips fast-mode rate)
- Free data format
- Two DMA events (transmit and receive)
- DMA event enable/disable capability
- Seven interrupts that can be used by the CPU
- Module enable/disable capability
- The SDA and SCL are optionally configurable as general purpose I/O
- Slew rate control of the outputs
- Open drain control of the outputs
- Programmable pullup/pulldown capability on the inputs
- Supports Ignore NACK mode

NOTE

This I2C module does not support:

- High-speed (HS) mode
- C-bus compatibility mode
- The combined format in 10-bit address mode (the I2C sends the slave address second byte every time it sends the slave address first byte)

PRODUCT PREVIEW

5.10.2 I2C I/O Timing Specifications

Table 5-27. I2C Signals (SDA and SCL) Switching Characteristics[1]

Parameter		Standard Mode		Fast Mode		Unit
		MIN	MAX	MIN	MAX	
$t_{c(I2CCLK)}$	Cycle time, Internal Module clock for I2C, prescaled from VCLK	75.2	149	75.2	149	ns
$t_{c(SCL)}$	Cycle time, SCL	10		2.5		ms
$t_{su(SCLH-SDAL)}$	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6		ms
$t_{h(SCLL-SDAL)}$	Hold time, SCL low after SDA low (for a repeated START condition)	4		0.6		ms
$t_{w(SCLL)}$	Pulse duration, SCL low	4.7		1.3		ms
$t_{w(SCLH)}$	Pulse duration, SCL high	4		0.6		ms
$t_{su(SDA-SCLH)}$	Setup time, SDA valid before SCL high	250		100		ns
$t_{h(SDA-SCLL)}$	Hold time, SDA valid after SCL low (for I2C bus devices)	0	3.45[2]	0	0.9	ms
$t_{w(SDAH)}$	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		ms
$t_{su(SCLH-SDAH)}$	Setup time, SCL high before SDA high (for STOP condition)	4.0		0.6		ms
$t_{w(SP)}$	Pulse duration, spike (must be suppressed)			0	50	ns
C_b [3]	Capacitive load for each bus line		400		400	pF

(1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
(2) The maximum $t_{h(SDA-SCLL)}$ for I2C bus devices has only to be met if the device does not stretch the low period ($t_{w(SCLL)}$) of the SCL signal.
(3) C_b = The total capacitance of one bus line in pF.
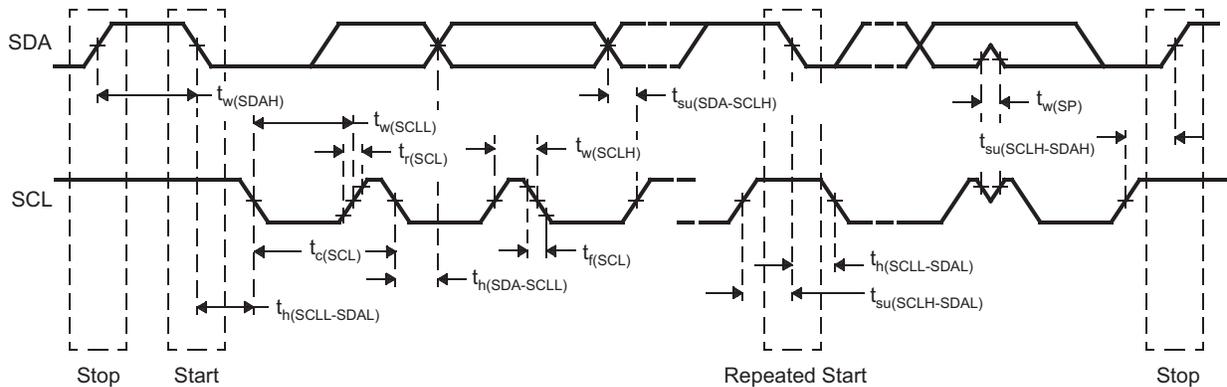

Figure 5-13. I2C Timings

NOTE

- A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the VIHmin of the SCL signal) to bridge the undefined region of the falling edge of SCL.

- The maximum $t_{h(SDA-SCLL)}$ has only to be met if the device does not stretch the LOW period ($t_{w(SCLL)}$) of the SCL signal.

- A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement $t_{su(SDA-SCLH)} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line tr max + $t_{su(SDA-SCLH)}$.

- C_b = total capacitance of one bus line in pF. If mixed with fast-mode devices, faster fall-times are allowed.

PRODUCT PREVIEW

5.11 Multi-Buffered / Standard Serial Peripheral Interface

The MibSPI is a high-speed synchronous serial input/output port that allows a serial bit stream of programmed length (2 to 16 bits) to be shifted in and out of the device at a programmed bit-transfer rate. Typical applications for the SPI include interfacing to external peripherals, such as I/Os, memories, display drivers, and analog-to-digital converters.

5.11.1 Features

Both Standard and MibSPI modules have the following features:
- 16-bit shift register
- Receive buffer register
- 8-bit baud clock generator
- SPICLK can be internally-generated (master mode) or received from an external clock source (slave mode)
- Each word transferred can have a unique format
- SPI I/Os not used in the communication can be used as digital input/output signals

Table 5-28. MibSPI/SPI Configurations

MibSPIx/SPIx	I/Os
MibSPI1	MIBSPI1SIMO[1:0], MIBSPI1SOMI[1:0], MIBSPI1CLK, MIBSPI1nCS[5:0], MIBSPI1nENA
MibSPI3	MIBSPI3SIMO, MIBSPI3SOMI, MIBSPI3CLK, MIBSPI3nCS[5:0], MIBSPI3nENA
MibSPI5	MIBSPI5SIMO[3:0], MIBSPI5SOMI[3:0], MIBSPI5CLK, MIBSPI5nCS[3:0], MIBSPI5nENA
SPI2	SPI2SIMO, ZSPI2SOMI, SPI2CLK, SPI2nCS[1:0], SPI2nENA
SPI4	SPI4SIMO, SPI4SOMI, SPI4CLK, SPI4nCS[0], SPI4nENA

5.11.2 MibSPI Transmit and Receive RAM Organization

The Multibuffer RAM is comprised of 128 buffers. Each entry in the Multibuffer RAM consists of 4 parts: a 16-bit transmit field, a 16-bit receive field, a 16-bit control field and a 16-bit status field. The Multibuffer RAM can be partitioned into multiple transfer group with variable number of buffers each. Each MibSPIx module supports 8 transfer groups.

5.11.3 MibSPI Transmit Trigger Events

Each of the transfer groups can be configured individually. For each of the transfer groups a trigger event and a trigger source can be chosen. A trigger event can be for example a rising edge or a permanent low level at a selectable trigger source. For example, up to 15 trigger sources are available which can be utilized by each transfer group. These trigger options are listed in Table 5-29, Section 5.11.3.2 and Section 5.11.3.3 for MibSPI1, MibSPi3 and MibSPI5 respectively.

5.11.3.1 MIBSPI1 Event Trigger Hookup

Table 5-29. MIBSPI1 Event Trigger Hookup

Event #	TGxCTRL TRIGSRC[3:0]	Trigger
Disabled	0000	No trigger source
EVENT0	0001	GIOA[0]
EVENT1	0010	GIOA[1]
EVENT2	0011	GIOA[2]
EVENT3	0100	GIOA[3]
EVENT4	0101	GIOA[4]
EVENT5	0110	GIOA[5]
EVENT6	0111	GIOA[6]
EVENT7	1000	GIOA[7]
EVENT8	1001	N2HET1[8]
EVENT9	1010	N2HET1[10]
EVENT10	1011	N2HET1[12]
EVENT11	1100	N2HET1[14]
EVENT12	1101	N2HET1[16]
EVENT13	1110	N2HET1[18]
EVENT14	1111	Intern Tick counter

NOTE

For N2HET1 trigger sources, the connection to the MibSPI1 module trigger input is made from the input side of the output buffer (at the N2HET1 module boundary). This way, a trigger condition can be generated even if the N2HET1 signal is not selected to be output on the pad.

NOTE

For GIOx trigger sources, the connection to the MibSPI1 module trigger input is made from the output side of the input buffer. This way, a trigger condition can be generated either by selecting the GIOx pin as an output pin and selecting the pin to be a GIOx pin, or by driving the GIOx pin from an external trigger source. If the mux control module is used to select different functionality instead of the GIOx signal, then care must be taken to disable GIOx from triggering MibSPI1 transfers; there is no multiplexing on the input connections.

5.11.3.2 MIBSPI3 Event Trigger Hookup

EVENT12	1101	N2HET1[16]
EVENT13	1110	N2HET1[18]
EVENT14	1111	Intern Tick counter

NOTE

For N2HET1 trigger sources, the connection to the MibSPI3 module trigger input is made from the input side of the output buffer (at the N2HET1 module boundary). This way, a trigger condition can be generated even if the N2HET1 signal is not selected to be output on the pad.

NOTE

For GIOx trigger sources, the connection to the MibSPI3 module trigger input is made from the output side of the input buffer. This way, a trigger condition can be generated either by selecting the GIOx pin as an output pin and selecting the pin to be a GIOx pin, or by driving the GIOx pin from an external trigger source. If the mux control module is used to select different functionality instead of the GIOx signal, then care must be taken to disable GIOx from triggering MibSPI3 transfers; there is no multiplexing on the input connections.

5.11.3.3   MIBSPI5 Event Trigger Hookup

Table 5-31. MIBSPI5 Event Trigger Hookup

Event #	TGxCTRL TRIGSRC[3:0]	Trigger
Disabled	0000	No trigger source
EVENT0	0001	GIOA[0]
EVENT1	0010	GIOA[1]
EVENT2	0011	GIOA[2]
EVENT3	0100	GIOA[3]
EVENT4	0101	GIOA[4]
EVENT5	0110	GIOA[5]

EVENT7	1000	GIOA[7]
EVENT8	1001	N2HET1[8]
EVENT9	1010	N2HET1[10]
EVENT10	1011	N2HET1[12]
EVENT11	1100	N2HET1[14]
EVENT12	1101	N2HET1[16]
EVENT13	1110	N2HET1[18]
EVENT14	1111	Intern Tick counter

NOTE

For N2HET1 trigger sources, the connection to the MibSPI5 module trigger input is made from the input side of the output buffer (at the N2HET1 module boundary). This way, a trigger condition can be generated even if the N2HET1 signal is not selected to be output on the pad.

NOTE

For GIOx trigger sources, the connection to the MibSPI5 module trigger input is made from the output side of the input buffer. This way, a trigger condition can be generated either by selecting the GIOx pin as an output pin and selecting the pin to be a GIOx pin, or by driving the GIOx pin from an external trigger source. If the mux control module is used to select different functionality instead of the GIOx signal, then care must be taken to disable GIOx from triggering MibSPI5 transfers; there is no multiplexing on the input connections.

		Hold time SPICLK high until CS inactive (clock polarity = 1)		$0.5*t_{c(SPC)M} + T2CDELAY*t_{c(VCLK)} + t_{c(VCLK)} - t_{r(SPC)} + tr(SPICS) - 5$	$0.5*t_{c(SPC)M} + T2CDELAY*t_{c(VCLK)} + t_{c(VCLK)} - t_{r(SPC)} + t_{r(SPICS)} + 8$	ns
10	t_{SPIENA}	SPIENAn Sample point		$(C2TDELAY+1) * t_{c(VCLK)} - t_{f(SPICS)} - 25$	$(C2TDELAY+1)*t_{c(VCLK)}$	ns
11	$t_{SPIENAW}$	SPIENAn Sample point from write to buffer			$(C2TDELAY+2)*t_{c(VCLK)}$	ns

(1) The MASTER bit (SPIGCR1.0) is set and the CLOCK PHASE bit (SPIFMTx.16) is set.
(2) $t_{c(VCLK)}$ = interface clock cycle time = $1 / f_{(VCLK)}$
(3) For rise and fall timings, see Table 3-4.
(4) When the SPI is in Master mode, the following must be true:
For PS values from 1 to 255: $t_{c(SPC)M} \geq (PS +1)t_{c(VCLK)} \geq 40ns$, where PS is the prescale value set in the SPIFMTx.[15:8] register bits.
For PS values of 0: $t_{c(SPC)M} = 2t_{c(VCLK)} \geq 40ns$.
The external load on the SPICLK pin must be less than 60pF.
(5) The active edge of the SPICLK signal referenced is controlled by the CLOCK POLARITY bit (SPIFMTx.17).
(6) C2TDELAY and T2CDELAY is programmed in the SPIDELAY register

5.12 Universal Serial Bus Controller

5.12.1 Features

This device provides several varities of USB functionality, including:

- One full-speed USB device port compatible with the USB Specification Revision 2.0 and USB Specification Revision 1.1
- Two USB host ports compatible with USB Specification Revision 2.0, which is based on the OHCI Specification For USB Release 1.0.

5.12.2 Electrical and Timing Specifications

Table 5-36. Full-Speed USB Interface Timing Requirements[1]

NO.	Parameter		MIN	MAX	Unit
FSU20	$t_{d(VPL, VML)}$	Time duration, RCVDPLS and RCVDMNS low together during transition		14	ns
FSU21	$t_{d(VPH, VMH)}$	Time duration, RCVDPLS and RCVDMNS high together during transition		8	ns

(1) The capacitive loading is equivalent tp 15 pF

Table 5-37. Full-Speed USB Interface Switching Characteristics[1]

NO.	Parameter		MIN	MAX	Unit
FSU15	$t_{d(TXENL–DATV)}$	Delay time TXENL active to TXDPLS valid	0	1.5	ns

6 Device and Documentation Support

6.1 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all devices.Each device has one of three prefixes: X, P, or null (no prefix) (for example, xRM46L852). These prefixes represent evolutionary stages of product development from engineering prototypes through fully qualified production devices/tools.

Device development evolutionary flow:

x   Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.

P   Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.

null   Fully-qualified production device.

x and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

The figure below illustrates the numbering and symbol nomenclature for the RM46Lx30 devices.

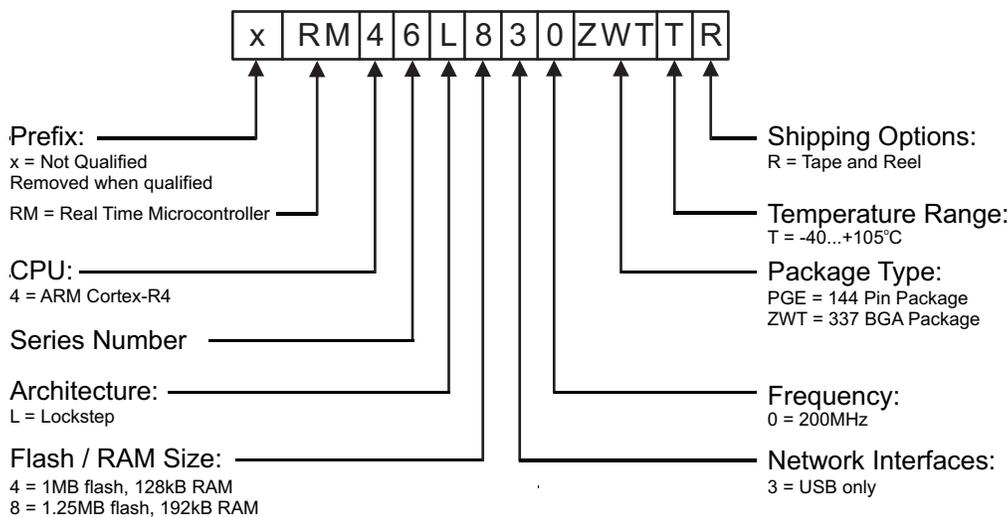

Figure 6-1. RM46Lx30 Device Numbering Conventions

6.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

6.3 Device Identification

6.3.1 Device Identification Code Register

The device identification code register identifies several aspects of the device including the silicon version. The details of the device identification code register are shown in Table 6-1. The device identification code register value for this device is:

- Rev 0 = 0x8046AD05

Figure 6-2. Device ID Bit Allocation Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CP-15							UNIQUE ID								TECH
R-1							R-00000000100011								R-0

R-101			R-0	R-1	R-10		R-1	R-00000					R-1	R-0	R-1

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Table 6-1. Device ID Bit Allocation Register Field Descriptions

Bit	Field	Value	Description
31	CP15		Indicates the presence of coprocessor 15
		1	CP15 present
30-17	UNIQUE ID	100011	Unique device identification number This bitfield holds a unique number for a dedicated device configuration (die).
16-13	TECH		Process technology on which the device is manufactured.
		0101	F021
12	I/O VOLTAGE		I/O voltage of the device.
		0	I/O are 3.3v
11	PERIPHERAL PARITY	1	Peripheral Parity Parity on peripheral memories
10-9	FLASH ECC		Flash ECC
		10	Program memory with ECC
8	RAM ECC		Indicates if RAM memory ECC is present.
		1	ECC implemented
7-3	REVISION		Revision of the Device.
2-0	101		The platform family ID is always 0b101

6.3.2 Die Identification Registers

The four die ID registers at addresses 0xFFFFE1F0, 0xFFFFE1F4, 0xFFFFE1F8 and FFFFE1FC form a 128-bit dieid with the information as shown in Table Table 6-2.

Table 6-2. Die-ID Registers

Item	# of Bits	Bit Location
X Coord. on Wafer	8	7..0
Y Coord. on Wafer	8	15..8
Wafer #	6	21..16
Lot #	24	45..22
Reserved	82	127..46

7 Mechanical Data

7.1 Thermal Data

Table 7-1 shows the thermal resistance characteristics for the QFP - PGE mechanical package.

Table 7-2 shows the thermal resistance characteristics for the BGA - ZWT mechanical package.

**Table 7-1. Thermal Resistance Characteristics
(PGE Package)**

PARAMETER	°C / W
$R\Theta_{JA}$	45
$R\Theta_{JC}$	5

**Table 7-2. Thermal Resistance Characteristics
(ZWT Package)**

PARAMETER	°C / W
$R\Theta_{JA}$	18.8
$R\Theta_{JC}$	7.1

7.2 Packaging Information

The following packaging information reflects the most current released data available for the designated device(s). This data is subject to change without notice and without revision of this document.

PRODUCT PREVIEW

Functional Safety Disclaimer for Safety Critical Solutions

TI's safety critical solutions, including integrated circuits, software and tools help TI's customers create end products that may be used in appropriately designed safety-critical applications to comply with functional safety standards or requirements.

Buyers represent and agree that they have all the necessary expertise to design, manage and assure effective system-level safeguards to anticipate, monitor and control system failures in safety-critical applications. Buyers agree and accept sole responsibility to meet and comply with all applicable regulatory standards and safety-related requirements concerning their systems and end-products which use TI's safety-critical applications. Buyers will fully indemnify TI and its representatives against any damages arising out of the use of TI products in safety-critical applications.

TI integrated circuits are not authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

[1] The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

[2] Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

[3] MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
